Matthews, PhD; Alpa V. Patel, PhD

IMPORTANCE Leisure-time physical activity has been associated with lower risk of heart-disease and all-cause mortality, but its association with risk of cancer is not well understood.

OBJECTIVE To determine the association of leisure-time physical activity with incidence of common types of cancer and whether associations vary by body size and/or smoking.

DESIGN, SETTING, AND PARTICIPANTS We pooled data from 12 prospective US and European cohorts with self-reported physical activity (baseline, 1987-2004). We used multivariable Cox regression to estimate hazard ratios (HRs) and 95% confidence intervals for associations of leisure-time physical activity with incidence of 26 types of cancer. Leisure-time physical activity levels were modeled as cohort-specific percentiles on a continuous basis and cohort-specific results were synthesized by random-effects meta-analysis. Hazard ratios for high vs low levels of activity are based on a comparison of risk at the 90th vs 10th percentiles of

187,000 incident cancers

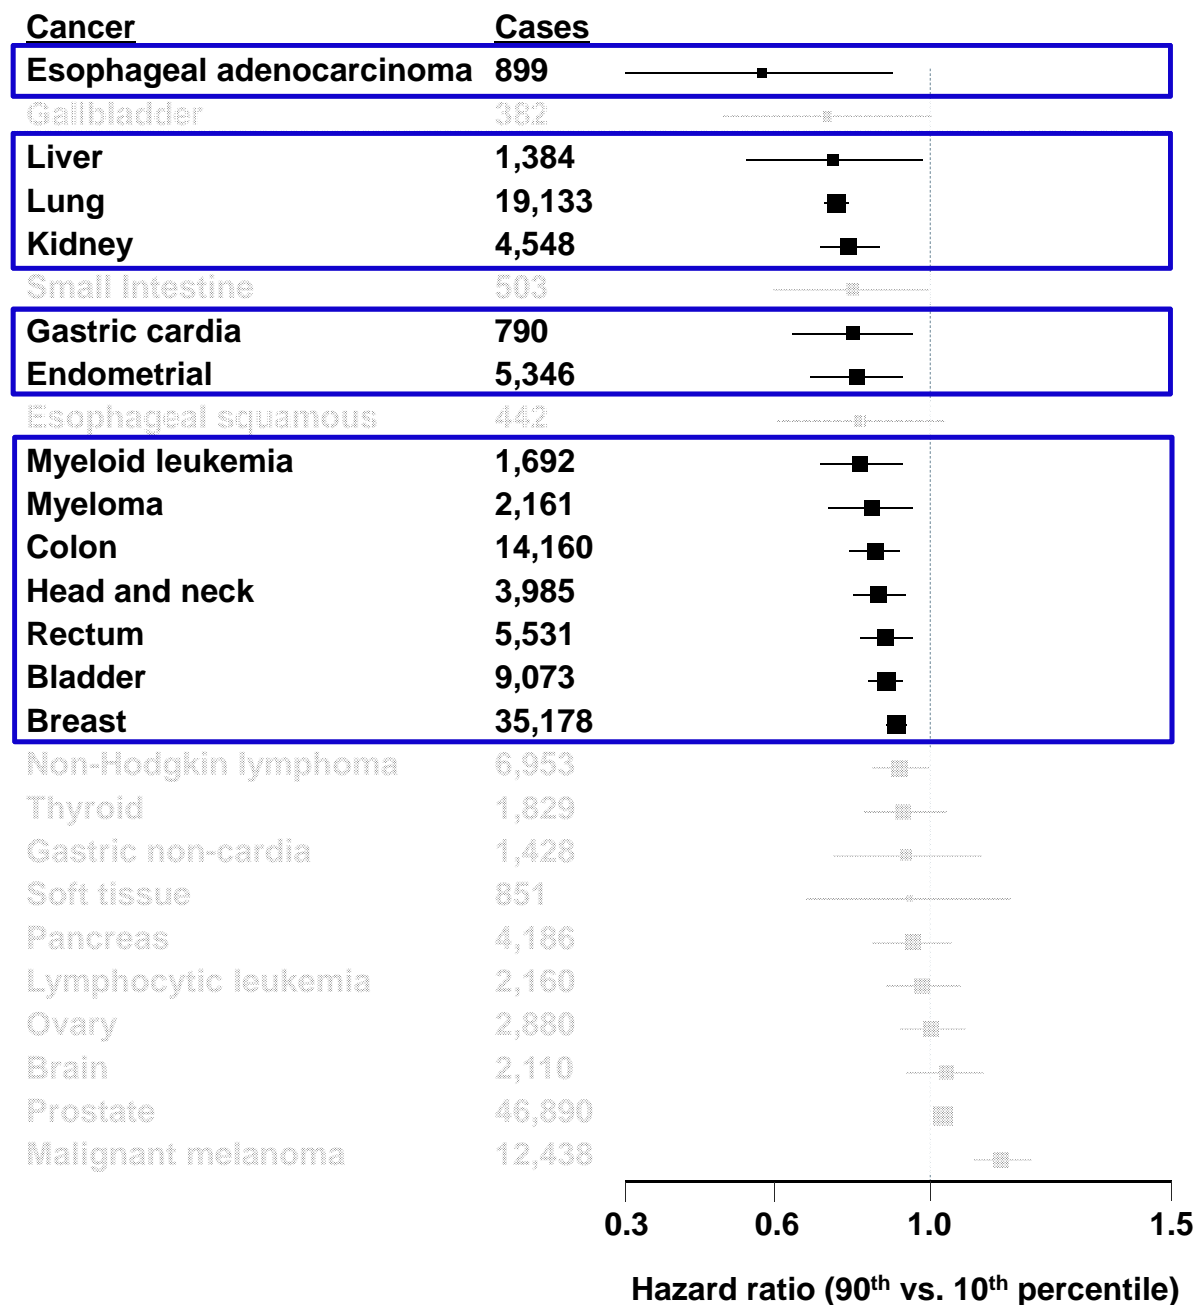

Main results

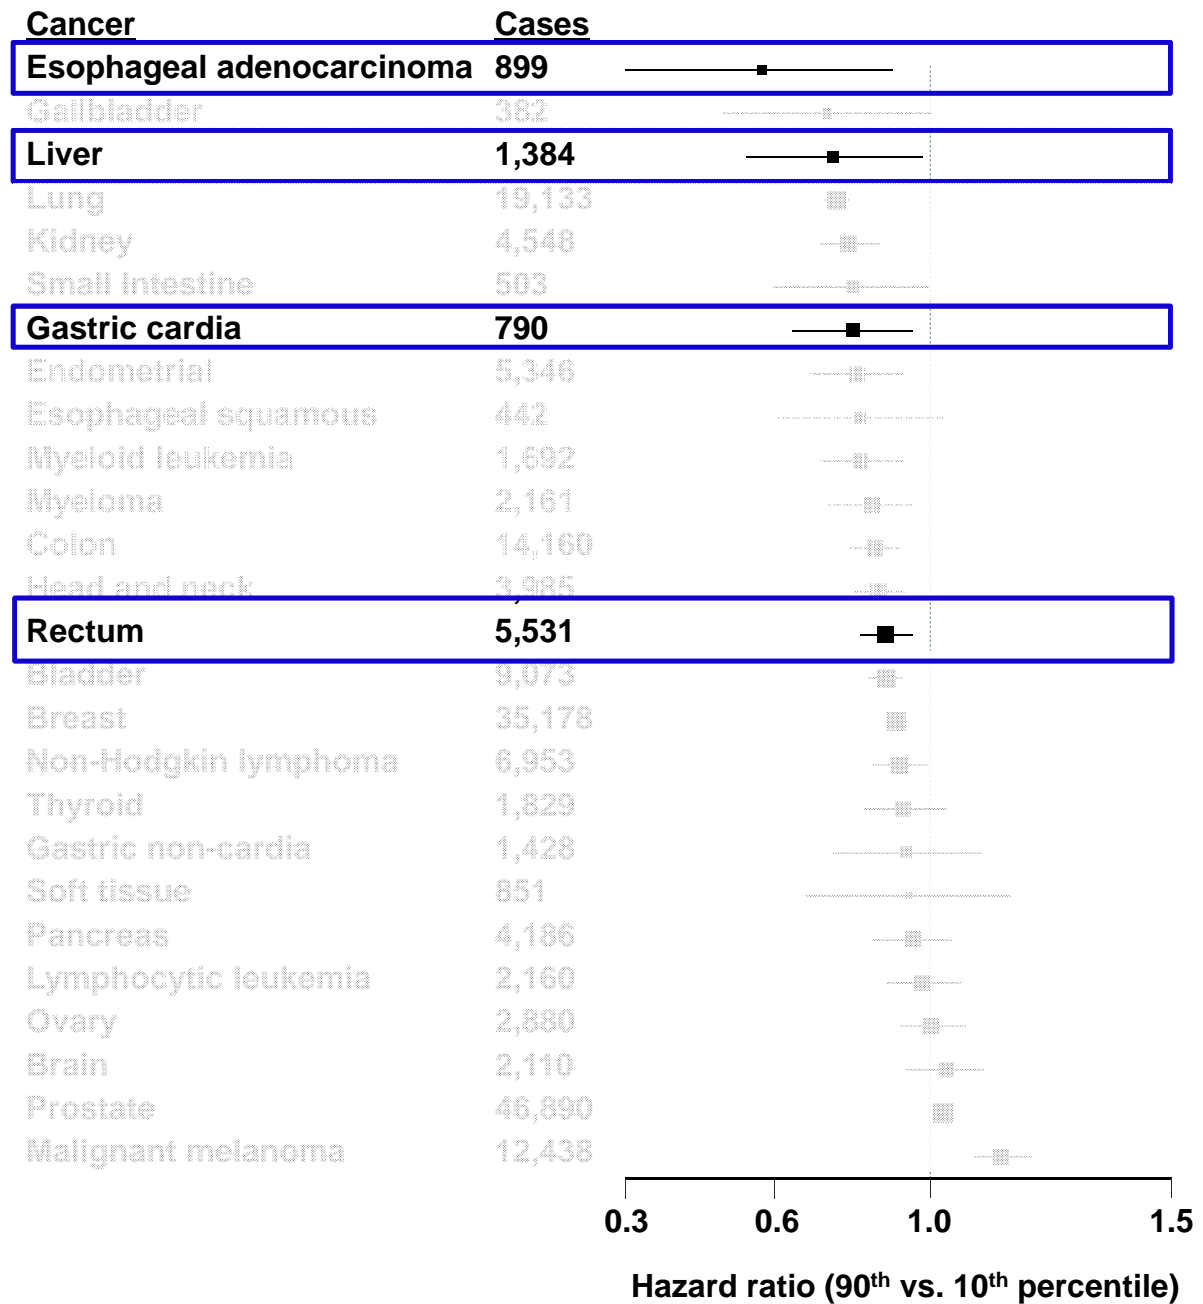

Previously established associations

Physical activity associated with lower risk of 10 additional cancers

Physical activity associated with lower risk of digestive cancers

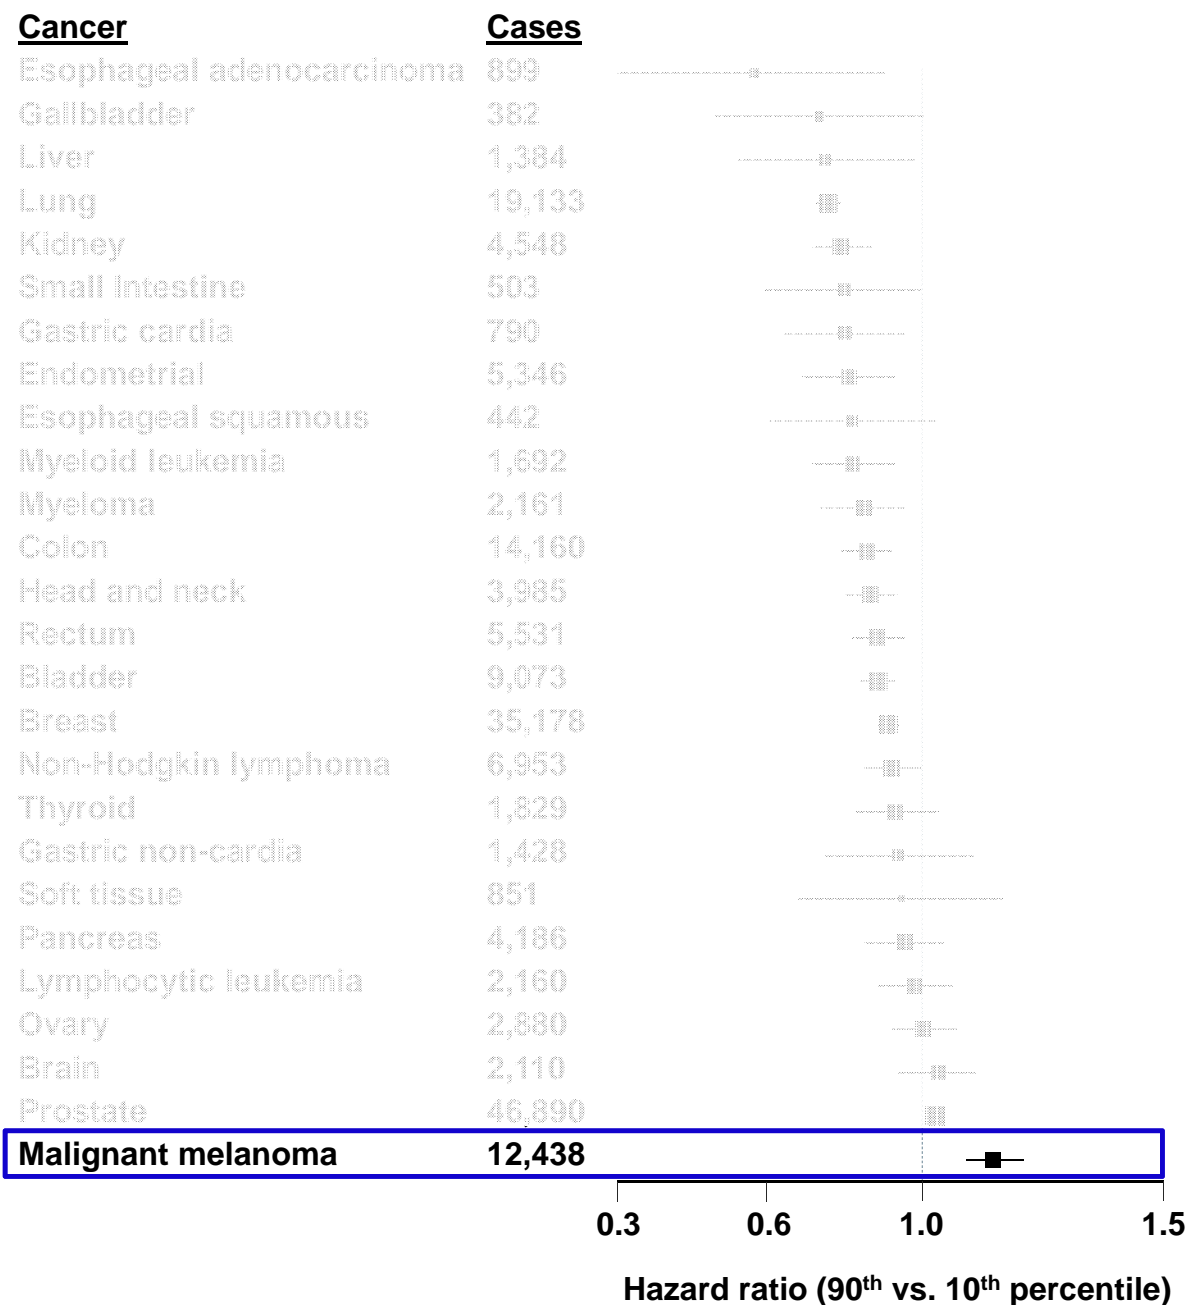

Physical activity associated with higher risk of prostate cancer and melanoma

..Advanced prostate cancer

Hazard ratio=0.99
95% CI: 0.88-1.10

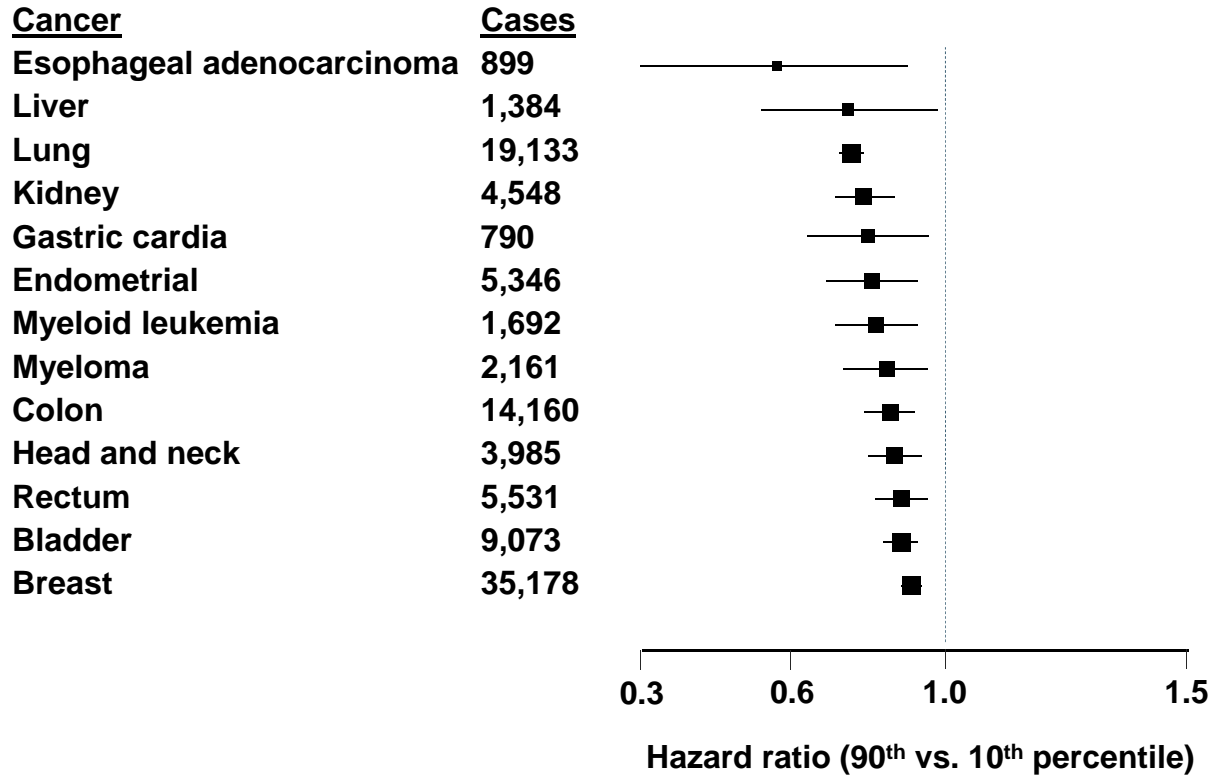

Physical activity associated with higher risk of prostate cancer and melanoma

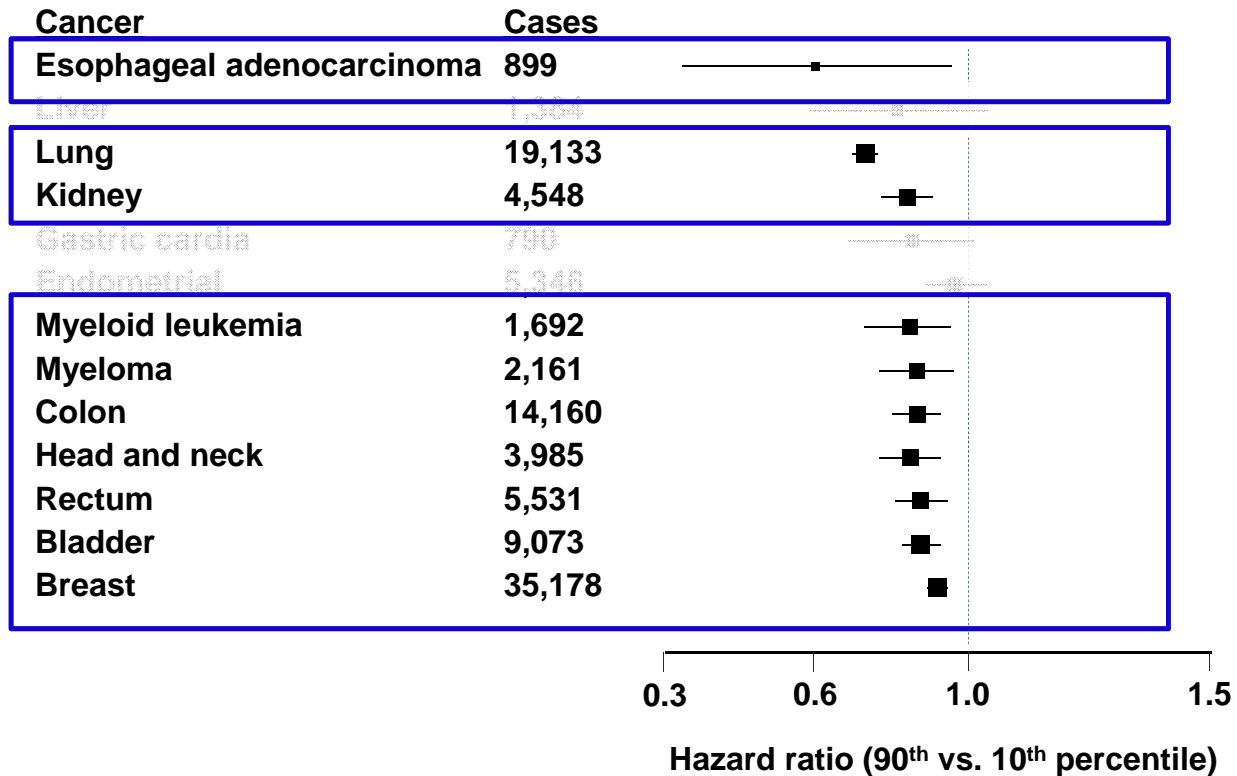

Is it
obesity?

Associations before BMI adjustment

Associations after BMI adjustment

BMI-Independent associations

Associations after BMI adjustment

Associations with and without BMI adjustment

Cancer	HR (95% CI) Not BMI Adjusted	HR (95% CI) BMI Adjusted
Liver	0.73 (0.55-0.98)	0.81 (0.61-1.09)
Gastric cardia	0.78 (0.64-0.95)	0.85 (0.69-1.04)
Endometrial	0.79 (0.68-0.92)	0.98 (0.89-1.09)

Associations with and without BMI adjustment

Cancer	HR (95% CI) Not BMI Adjusted	HR (95% CI) BMI Adjusted
Liver	0.73 (0.55-0.98)	0.81 (0.61-1.09)
Gastric cardia	0.78 (0.64-0.95)	0.85 (0.69-1.04)
Endometrial	0.79 (0.68-0.92)	0.98 (0.89-1.09)

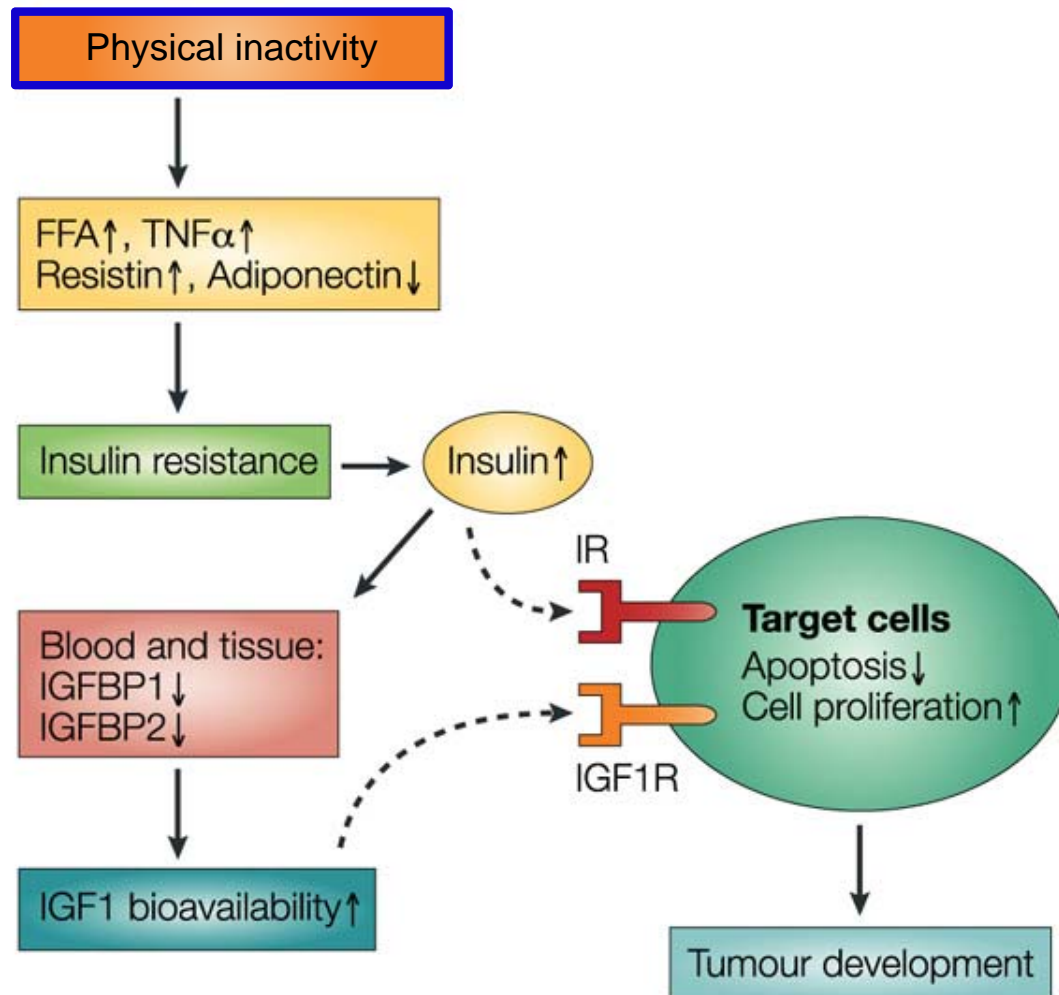

Potential mechanisms

Mechanism: Increased gut motility

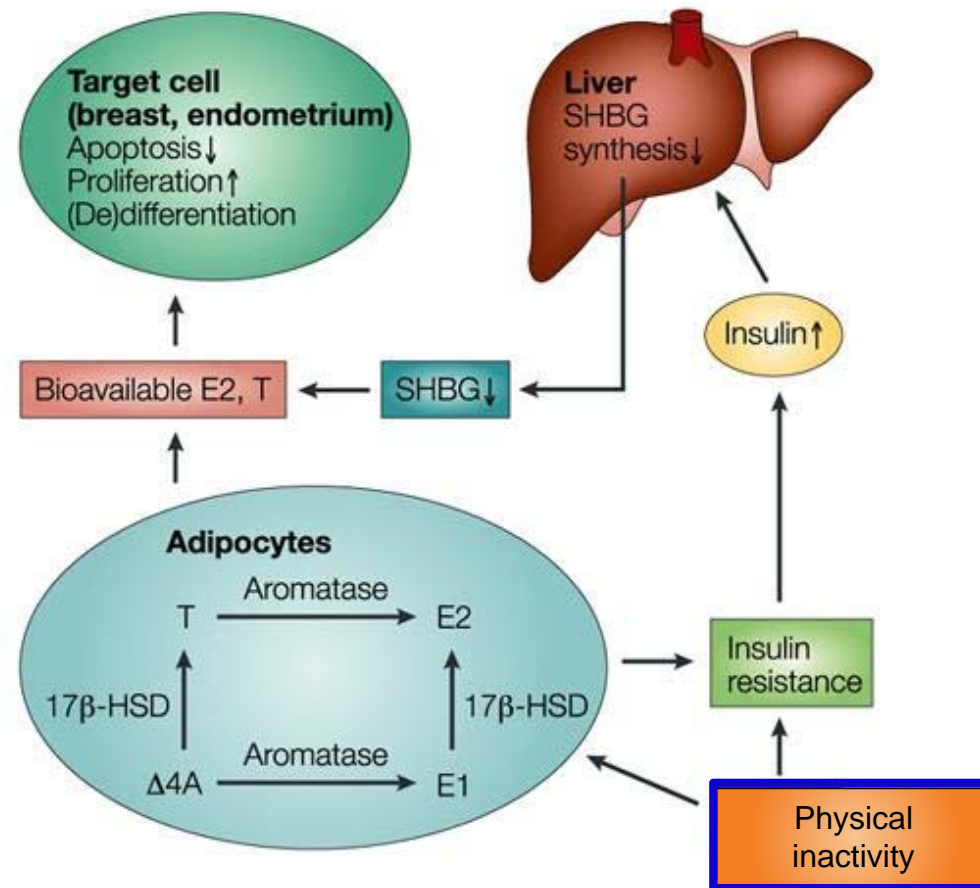

Mechanism: Insulin and metabolic effects

Calle and Kaaks. Nat Rev Cancer. 2004
Renehan et al. Nat Rev Cancer. 2015

Mechanism: Sex steroid hormones

Calle and Kaaks. Nat Rev Cancer. 2004
Renehan et al. Nat Rev Cancer. 2015

Mechanism: Chronic inflammation

Physical activity mechanisms act at multiple levels

Metabolomics

Blood

GC- and LC-
Mass spectrometry

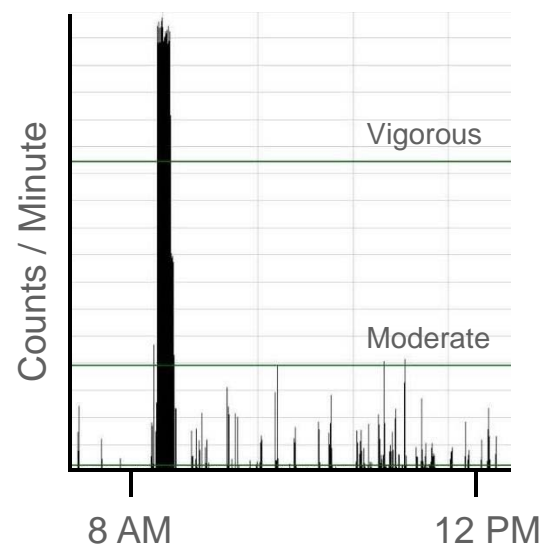

Hundreds of metabolites

Accelerometer-based physical activity study

- 339 Shanghai men and women (mean age 60)

1 week in every 3 months during 1 year

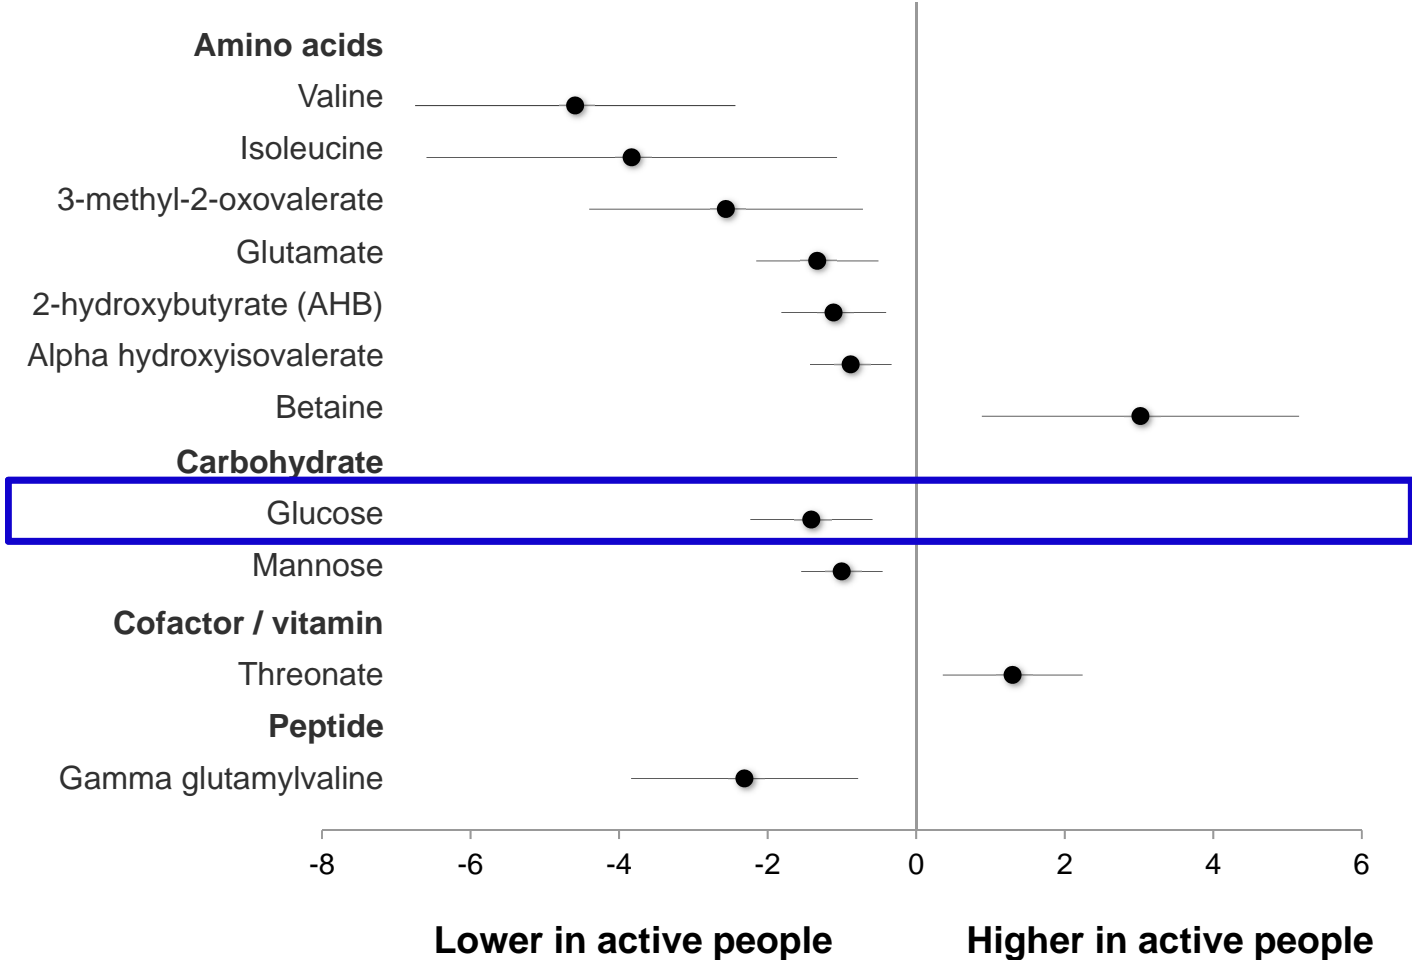

Average 1 year physical activity + fasting plasma

Xiao, Moore, et al. IJE 2016.

Manhattan plot of metabolite and physical activity associations

Physical activity is associated with 11 metabolites

Physical activity is associated with lower levels of amino acids

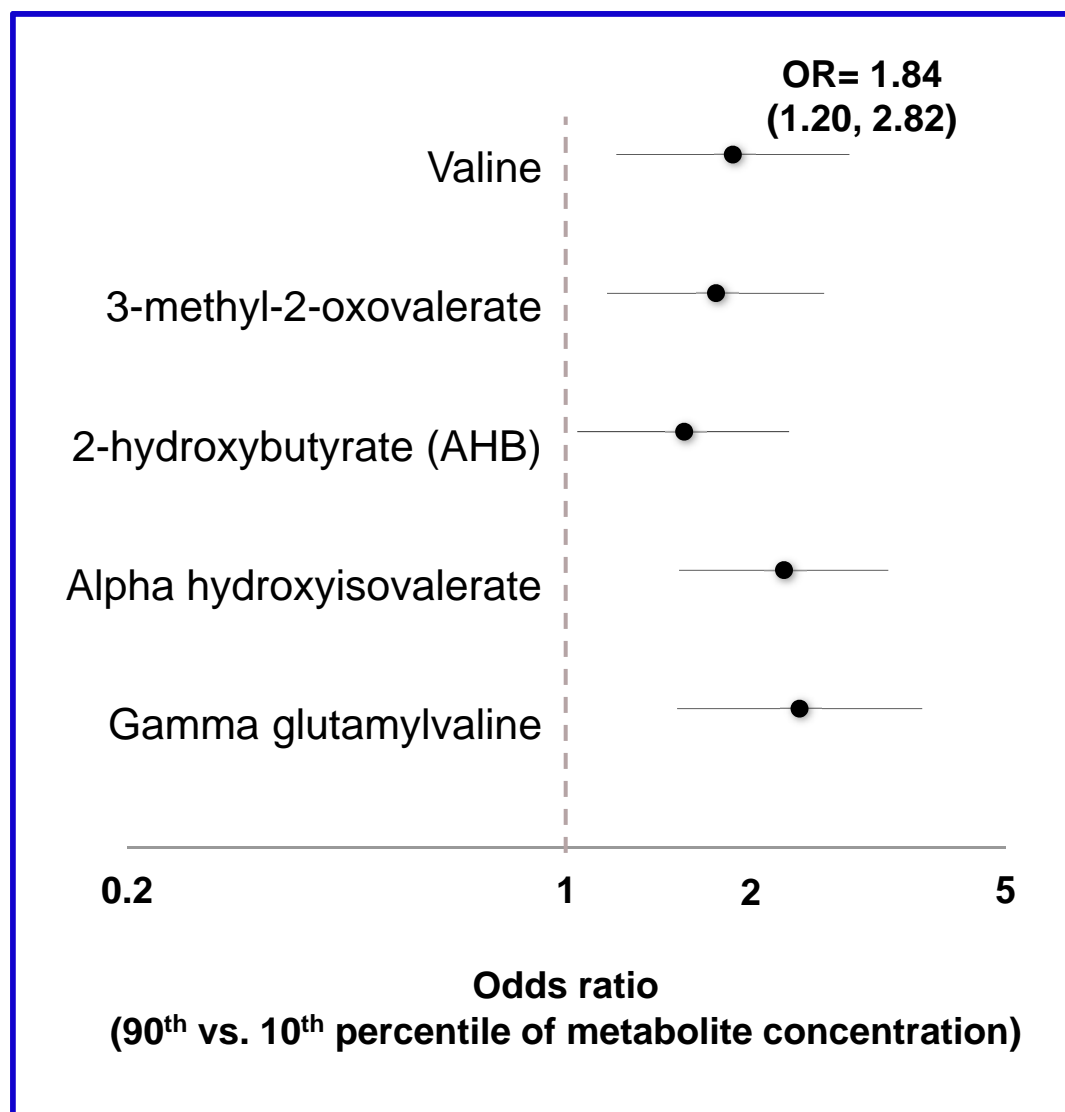

Metabolites and breast cancer risk

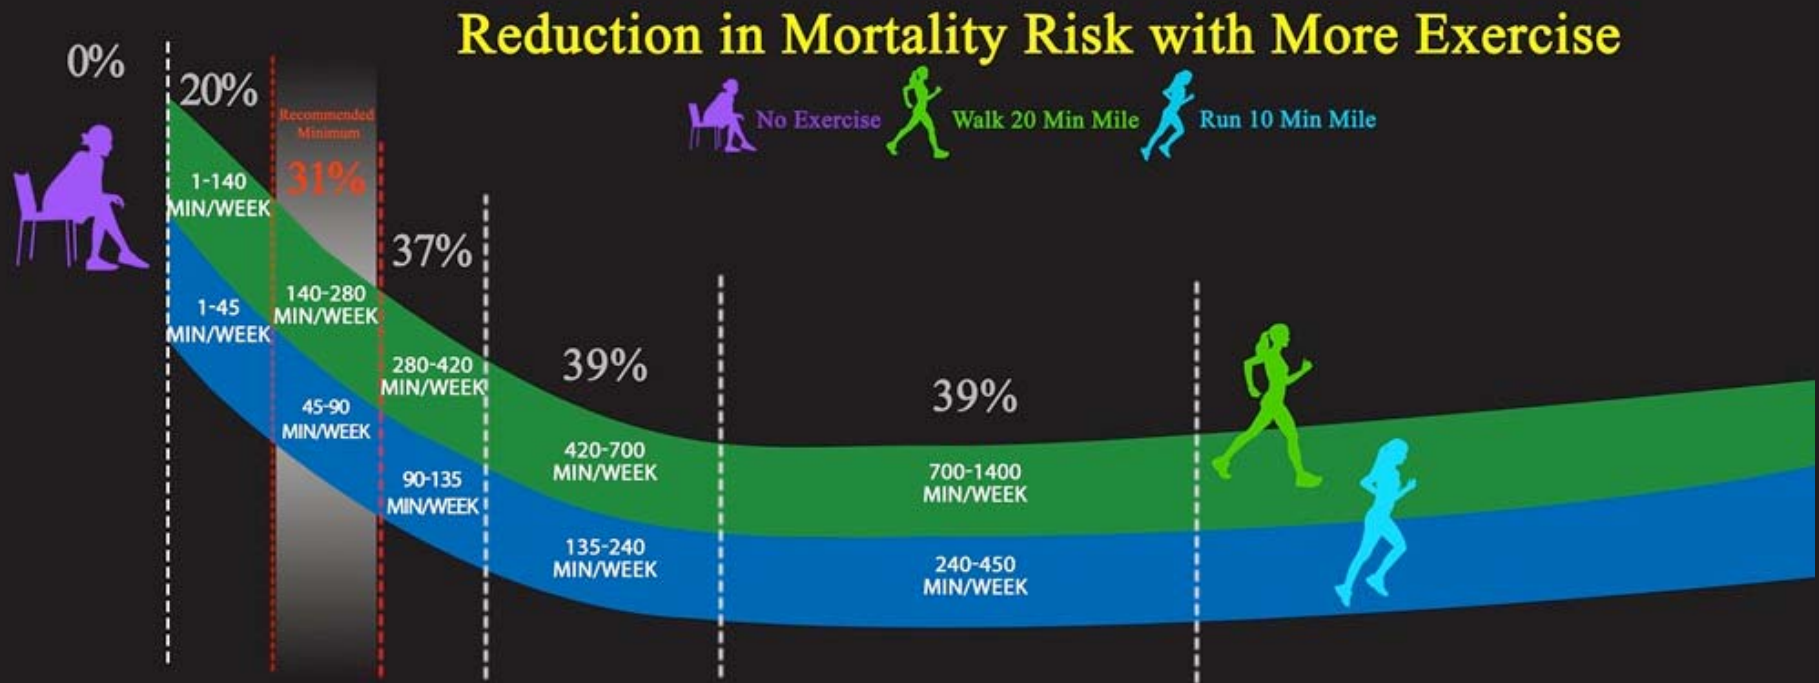

- Prostate, Lung, Colorectal, and Ovarian Cancer Screening Trial
- 418 estrogen receptor positive cases and 418 controls
- Pre-diagnostic serum (median 7 yr follow-up)

Moore et al. In preparation.

Amino acid metabolites associated with higher ER+ breast cancer risk

Physical activity has a broad-based role in health

This infographic summarizes the findings as reported in the manuscript published by Arem, et.al. *JAMA Internal Medicine* 2015

Complete results (double-click figure)

Figure 1. Summary multivariable^{*} hazard ratios (HR) and 95% confidence intervals (CI) for a higher (90th percentile) versus lower (10th percentile) level of leisure-time physical activity by cancer type[†]

^{*} Multivariable models were adjusted for age, gender, smoking status (never, former, current), alcohol consumption (0, 0.1-14.9, 15.0-29.9 and 30.0+ g/day), education (did not complete high school, completed high school, post high-school training, some college, completed college), and race/ethnicity (white, black, other). Models for endometrial, breast, and ovarian cancers are additionally adjusted for hormone replacement therapy use (ever, never), oral contraceptive use (ever, never), age at menarche (<10 years, 10-11 years, 12-13 years, 14+ years), age at menopause (premenopausal, 40-44 years, 45-49 years, 50-54 years, 55+ years), and parity (0 children, 1 child, 2 children, 3+ children).

[†] The Surveillance Epidemiology and End Results site recode and the International Classification of Diseases for Oncology, Third Edition code corresponding to each cancer type are shown in Supplementary Table 1.

[‡] P_{heterogeneity} indicates the P-value for heterogeneity of hazard ratios across participating studies.

Physical activity association by smoking group

Cancer	HR (95% CI) Current smokers	HR (95% CI) Never smokers	P_{interaction}
Lung	0.73 (0.68-0.80)	1.03 (0.89-1.20)	<0.001
Head and neck	0.85 (0.65-1.10)	0.83 (0.68-1.02)	0.91

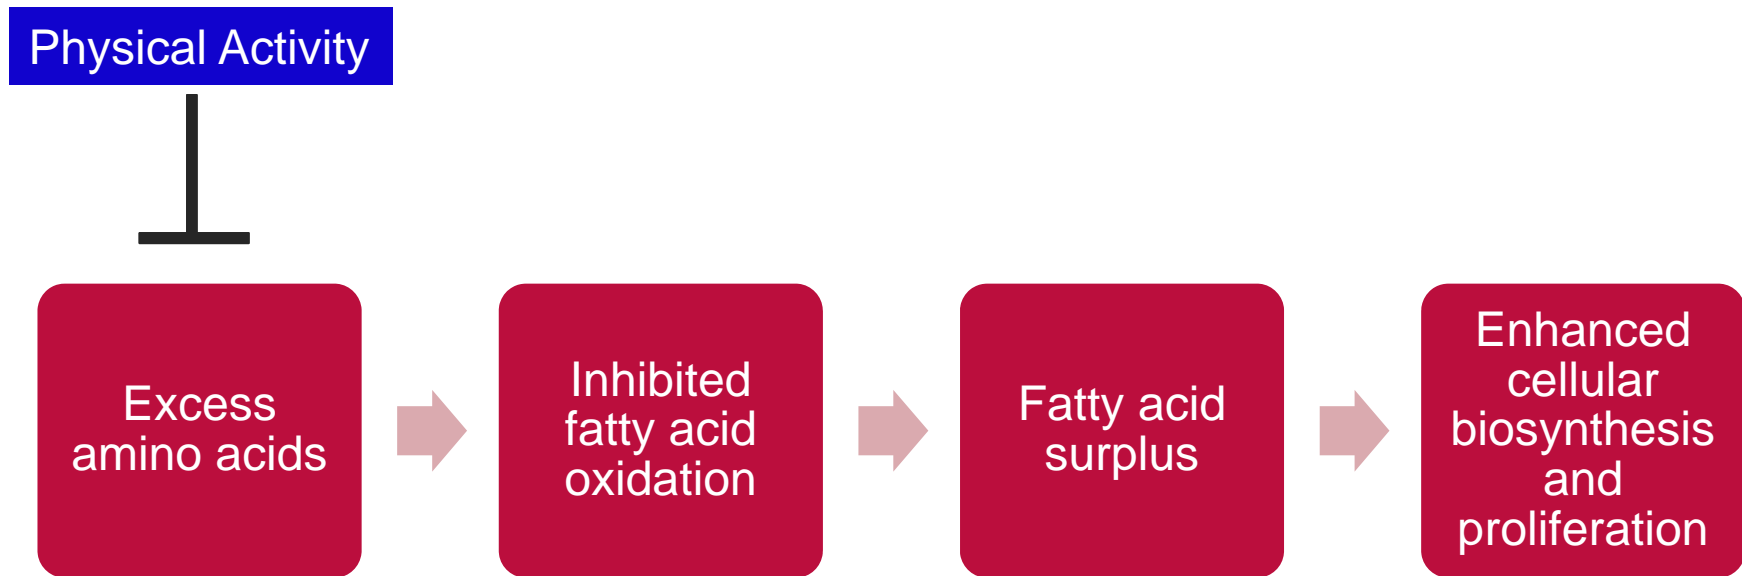

Effect modification by BMI (< vs. \geq 25.0 kg/m²)

<u>Cancer type</u>	<u>P for interaction</u>
Esophageal adenocarcinoma	.60
Gallbladder	.48
Liver	.51
Lung	.002
Kidney	.56
Small Intestine	.03
Gastric cardia	.02
Endometrial	<0.001
Esophageal squamous	.27
Myeloid leukemia	.68
Myeloma	.79
Colon	.81
Head and neck	.16
Rectum	.50
Bladder	.80
Breast	.92
Non-Hodgkin lymphoma	.33
Thyroid	.37
Gastric non-cardia	.68
Soft tissue	.90
Pancreas	.27
Lymphocytic leukemia	.26
Ovary	.76
Brain	.25
Prostate	.64
Malignant melanoma	.79

eFigure 7. Summary multivariable* hazard ratios (HR) and 95% confidence intervals (CI) for a higher (90th percentile) versus lower (10th percentile) level of leisure-time physical activity, by cancer type, stratified by race/ethnicity†.

A simplified model

Physical activity and metabolite associations

Metabolite	Class	Pathway
2-hydroxybutyrate (AHB)	Amino acid	Cysteine, methionine, SAM, taurine metabolism
glutamate	Amino acid	Glutamate metabolism
betaine	Amino acid	Glycine, serine and threonine metabolism
isoleucine	Amino acid	Valine, leucine and isoleucine metabolism
valine	Amino acid	Valine, leucine and isoleucine metabolism
alpha-hydroxyisovalerate	Amino acid	Valine, leucine and isoleucine metabolism
3-methyl-2-oxovalerate	Amino acid	Valine, leucine and isoleucine metabolism
mannose	Carbohydrate	Fructose, mannose, galactose, starch, and sucrose metabolism
glucose	Carbohydrate	Glycolysis, gluconeogenesis, pyruvate metabolism
threonate	Cofactors and vitamins	Ascorbate and aldarate metabolism
gamma-glutamylvaline	Peptide	gamma-glutamyl

Breast cancer and metabolomics

Study Design

Prostate, Lung, Colorectal and Ovarian Cancer Screening Trial

621 incident invasive breast cancer cases

418 were ER+ cases

Median follow-up prior to dx: 6.7 years

Matched 1:1 to controls on age, date of blood draw, hormone use

Metabolites

Non-fasting serum

LC-MS/GC-MS (Metabolon Inc.)

672 metabolites

Statistical analysis

Conditional logistic regression (All cases and ER+ cases)

Adjusted for breast cancer risk factors, hormone use, body mass index

False discovery rate of 0.2
