## OVERVIEW

To describe the current landscape of NIH<sup>1</sup>-funded awards in gastric and esophageal cancers and to facilitate the recommendation-making process of the Gastric & Esophageal Cancers Working Group, the Center for Research Strategy (CRS) at the National Cancer Institute (NCI) analyzed project data and provided data sets to the Working Group. Initially, CRS provided two data sets that correspond to funded NIH research project portfolios in esophageal and stomach cancer in fiscal year (FY) 2021, with each portfolio containing both competing (new) and non-competing projects. These data were identified using RCDC<sup>2</sup> disease categories “Esophageal Cancer” and “Stomach Cancer.” Multi-component projects, such as P01 and U54 grants, were identified at the sub-project level. Multi-year funded projects<sup>3</sup> were included if the budget covered FY 2021. More detail is provided in the Methods section below.

In addition, CRS used a machine learning model to assign International Cancer Research Partnership (ICRP) Common Scientific Outline (CSO) codes to projects. These codes are Biology, Etiology, Prevention, Early Detection, Treatment, and Cancer Control. A given project may be assigned to more than one CSO code. A panoply of information about each project was provided to enable the Working Group to better understand the attributes of each research portfolio, to determine what additional information may be useful, and to find research gaps. To facilitate these processes, CRS summarized each portfolio.

## METHODS

### Research Condition and Disease Categorization (RCDC)

CRS leveraged RCDC categories to identify awards relevant to stomach cancer and esophageal cancer, using the RCDC categories “esophageal cancer” or “stomach cancer”.

The RCDC system is used by the NIH in its reporting process to categorize funding in biomedical research for each fiscal year. The NIH currently reports funding to the public for 309 categories.

The RCDC system uses an automated text mining process in combination with a mathematical formula to produce a project index that consists of a weighted list of *concepts* from the RCDC thesaurus. The RCDC thesaurus consists of more than 180,000 biomedical terms and synonyms curated by NIH scientific experts and compiled from the National Library of Medicine’s MeSH thesaurus, CRISP thesaurus, NCI thesaurus, Metathesaurus, Jablonsky’s dictionary, and other sources from NIH institutes and centers.

Similarly, RCDC *categories* are developed using a mathematical formula that produces weighted lists of *concepts*. Ultimately, this process is used to define a *research area, condition, or disease* made up of well-defined RCDC *concepts* and *categories*.

---

<sup>1</sup> National Institutes of Health

<sup>2</sup> RCDC, which stands for Research, Condition, and Disease Categorization, is a process the NIH uses to categorize a grant application to various categories of disease, condition, or research area.

<sup>3</sup> Multi-year funded (MYF) grants are funded in full at the start of the project period from a single fiscal year’s appropriation. In contrast to MYF grants, the majority of NIH grants are funded on a year-by-year basis.

In sum, the RCDC system provides consistent text mining methods applied to all categories each year, clear and efficient processes for categorizing and reporting on NIH funding, tools for program and category analysis, and user and manual categories for specific reporting requirements. More information on RCDC can be found at <https://report.nih.gov/funding/categorical-spending/rcdc-faqs>

### **Base Projects**

NIH grants are either single- or multi-component awards that are issued with an alpha-numeric project identifier. Multi-component grants consist of a parent project and multiple subprojects that share the same base project number (a subset of the alpha-numeric identifier). Unique base projects function as the unit of measure for the analyses herein. In this regard, if more than one subproject within a multi-component grant is identified in the search strategy, the grant is only counted once via the unique base project number. Base projects were included if at least one subproject was identified in the search strategy.

### **Inclusion Criteria**

The following criteria were included in the project search to generate the list of awards:

- Primary/Admin projects (all NIH)
- Awarded only
- FY 2021
- Award supplements (Type 3)
- Extramural grant subprojects

Intramural projects and contracts were not included in this analysis, but Intramural projects were provided separately as requested by the Working Group.

All identified awards are publicly available through the NIH Research Portfolio Online Reporting Tools (RePORT) website at <https://report.nih.gov/>.

### **Portfolio Research Continua**

The International Cancer Research Partnership (ICRP) has crafted a set of coding guidelines, referred to as the Common Scientific Outline (CSO), that are used for discussing, comparing, and presenting cancer research portfolios. Grants can be broadly categorized into CSO codes using a machine learning model. Grants can be assigned into more than one of the following categories: 1. Biology; 2. Etiology; 3. Prevention; 4. Early Detection, Diagnosis, and Prognosis; 5. Treatment; 6. Cancer Control, Survivorship, and Outcomes Research. In some instances, there is not enough information to assign a grant to a particular category. Additionally, multiple CSO codes can be assigned to one grant. It is important to note that NCI/NIH does not assign CSO categories to grants and that categorization is independently applied in a retrospective manner.

## EXTRAMURAL PORTFOLIO SUMMARIES

The **NIH esophageal cancer portfolio** is comprised of 64 projects, corresponding to \$29.7M in total award total costs. NCI funded 70% of the projects. Seven other NIH institutes funded esophageal cancer research in FY 2021. For multi-component awards, such as P01 or U54, all subprojects were combined and counted as one project.

For NCI-funded projects in esophageal cancer, the largest grant category was R01 equivalent awards<sup>4</sup> (18 projects), followed by Cancer Center awards (11 projects). Other categories included substantial and small research program grants<sup>5</sup> (RPGs), small business innovation research (SBIR) awards, and career/training awards. The most common funding opportunity announcement was the Parent R01 Research Project Grant<sup>6</sup> (13 projects), followed by U54 BETRNET (Research Centers for Barrett's Esophagus Translational Research Network, 4 grants). The most frequent CSO category was Early Detection (21 projects), followed by Biology (14 projects); Figure 1 shows the awards in each category. Tables 1 and 2 list the NCI and NIH funded awards for esophageal cancer, along with their ICRP CSO codes.

**Figure 1. FY 2021 NCI-Administered Esophageal Cancer Projects by Scientific Area (ICRP CSO Code)**

The **NIH stomach cancer portfolio** is comprised of 61 projects, corresponding to \$24.7M in award total costs. NCI funded 64% of the projects. Five other NIH institutes funded stomach cancer research in FY 2021. For multi-component awards, such as P01 or U54, all subprojects were combined and counted as one project.

For NCI-funded projects in stomach cancer, the largest grant category was R01 equivalent awards (22 projects), followed by Centers (7 projects). The most common funding opportunity

<sup>4</sup> R01 is the oldest grant mechanism used by the NIH. It supports health-related research that aligns with the NIH mission. R01 equivalent awards from NCI include activity codes DP1, DP2, DP5, R01, R37, R56, RF1, RL1, U01

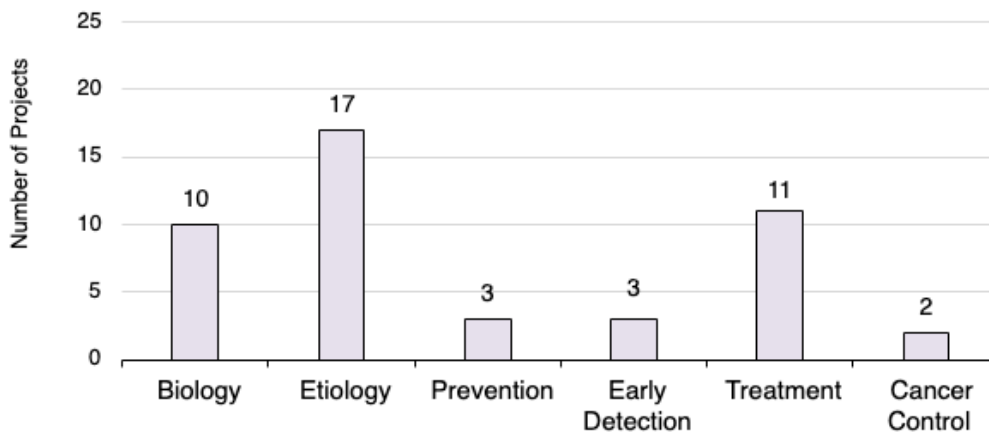

<sup>5</sup> Research Program Grants (RPG) is an award to support a specific research project in the area of PI's interest and competency. RPG is a broad category that includes R01 equivalents.

[https://grants.nih.gov/grants/glossary.htm#ResearchProjectGrant\(RPG\)](https://grants.nih.gov/grants/glossary.htm#ResearchProjectGrant(RPG))

<sup>6</sup> Parent R01 Research Project Grant is a general Funding Opportunity Announcement, which does not solicit applications in any particular research topic area, thus promoting investigator-initiated research.

announcement was also the Parent R01 Research Project Grant (13 projects), followed by Comprehensive Partnerships to Advance Cancer Health Equity U54 (4 grants). The most frequent CSO category for stomach cancer projects was Etiology (21 projects), followed by Treatment (11 projects) and Biology (10 projects); Figure 2 shows the awards in each category. Tables 3 and 4 list the NCI and NIH funded awards for esophageal cancer, along with their ICRP CSO codes.

**Figure 2. FY 2021 NCI-Administered Stomach Cancer Projects by Scientific Area (ICRP CSO Code)**

### INTRAMURAL PORTFOLIO SUMMARY

The intramural portfolio was manually curated at the request of the Working Group. Thirty-two NCI intramural research projects were identified that are focused on esophageal or stomach cancers for FY 2021; some projects are focused on both types of upper gastrointestinal cancers. The Center for Cancer Research (CCR) funds 21 of these, and the Division of Cancer Epidemiology & Genetics funds the other 11. Overall, there are 11 intramural awards focused on esophageal cancer, 4 on stomach, and 17 on multiple cancers that includes both stomach and esophageal cancers.
