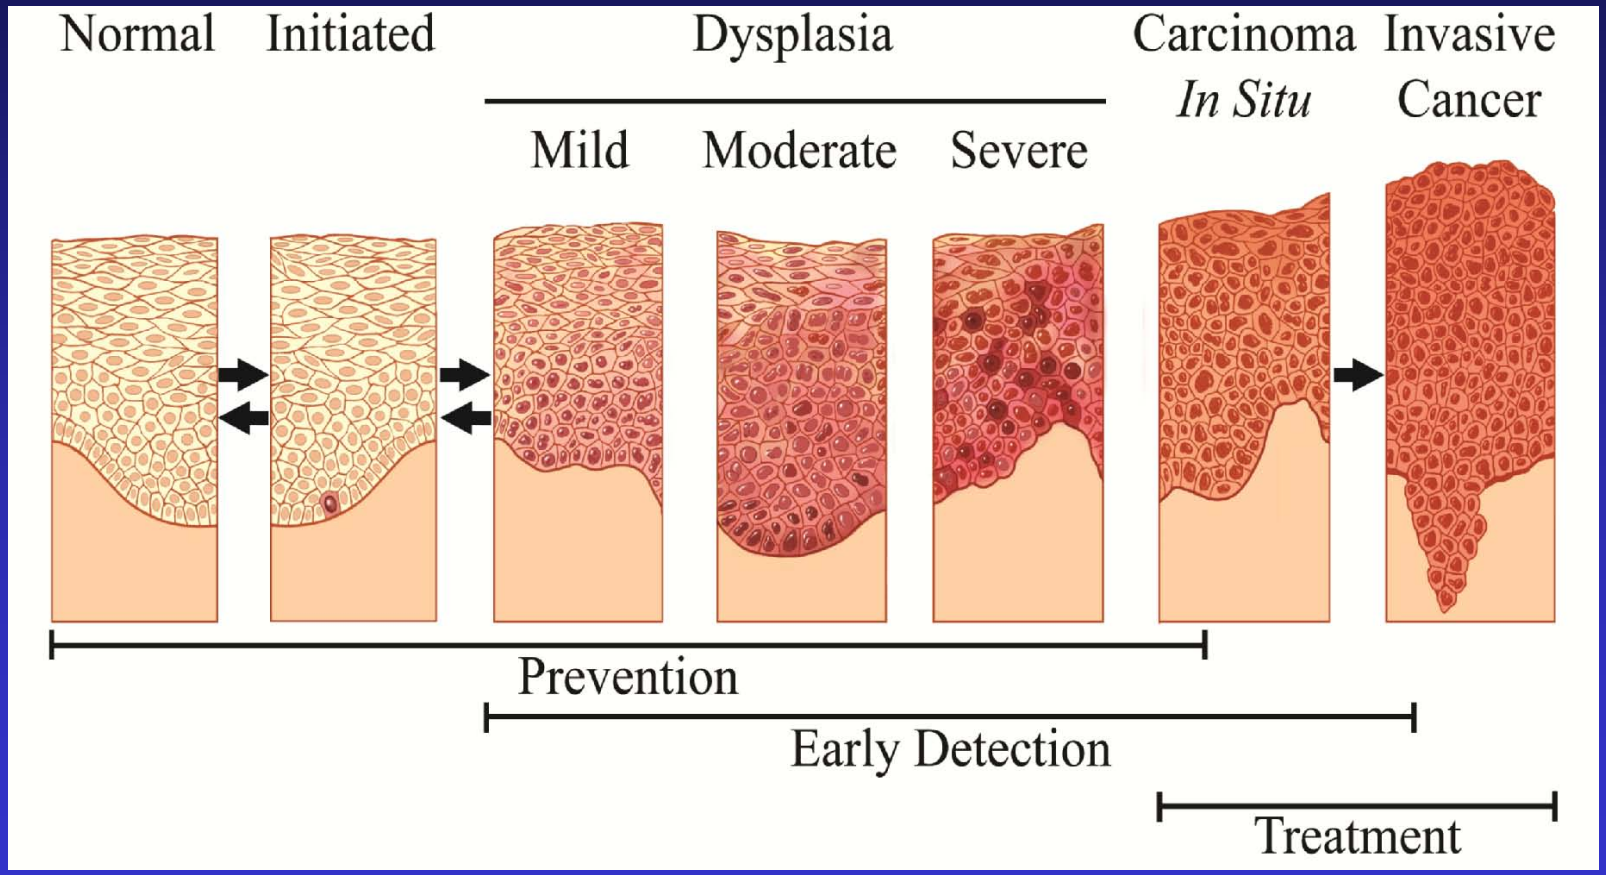
NCI's Consortia for Early Phase Prevention Trials

CTAC March 2012

Eva Szabo, MD
Chief, LUACRG
Division of Cancer Prevention, NCI

Development of Cancer: Opportunities for Intervention



Challenges for Cancer Prevention Drug Development - Scientific

- Targets/agent selection
- Risk-benefit balance
- Cohort selection
- Recognizing efficacy during early clinical development

Challenges for Cancer Prevention Drug Development - Logistical

- Expense and difficulty of biomarker trials requiring tissue acquisition
- Limited funding opportunities to conduct early phase clinical trials (grants, pharma)
- Magnitude and duration of definitive phase III trials, funding issues

Minimal Requirements for Preventive Strategies

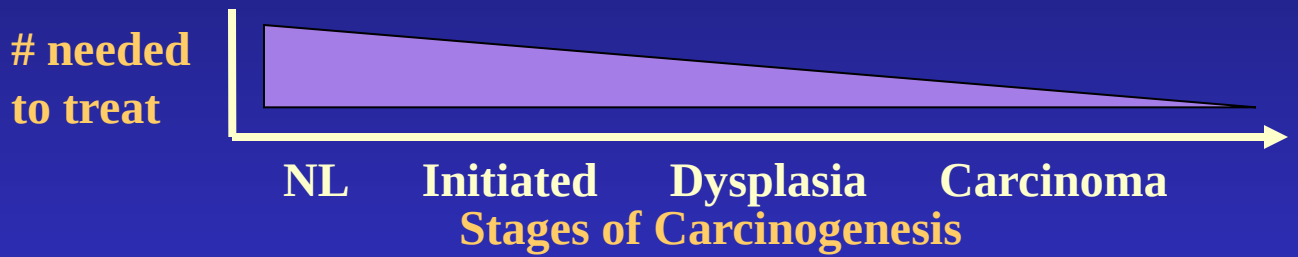
- **Benefit**
  - **Efficacy in preventing cancer and associated morbidity/mortality**
- **Risk**
  - **Lack of adverse side effects that increase morbidity/mortality from other diseases, short- and long-term (major side effects)**
  - **Tolerability of intervention (minor side effects affecting compliance)**

Efficacy: How Do We Identify New Agents?
Areas for Investment

- **Knowledge of mechanism**
  - **Example: HPV vaccine and cervical cancer**
  - **Need: understanding molecular pathogenesis**
- **Preclinical (*in vitro* and animal models)**
  - **Example: NSAID treated carcinogenesis and transgenic models**
  - **Need: models reflective of complexity of human disease**
- **Observational epidemiology (cohort and case-control studies)**
  - **Example: NSAIDs and colon cancer incidence/mortality**
- **Secondary endpoints from clinical trials (including non-malignant diseases)**
  - **Example: Tamoxifen/raloxifene and breast cancer**

Optimizing the Risk-Benefit Balance

- Identify individuals most likely to develop cancer in short time frame
  - Highest risk (e.g., presence of high-risk preneoplasia)
  - Homogeneous cohorts (current vs. former smokers, FAP vs. HNPCC vs. sporadic colorectal adenomas)
  - Pharmacogenetic considerations

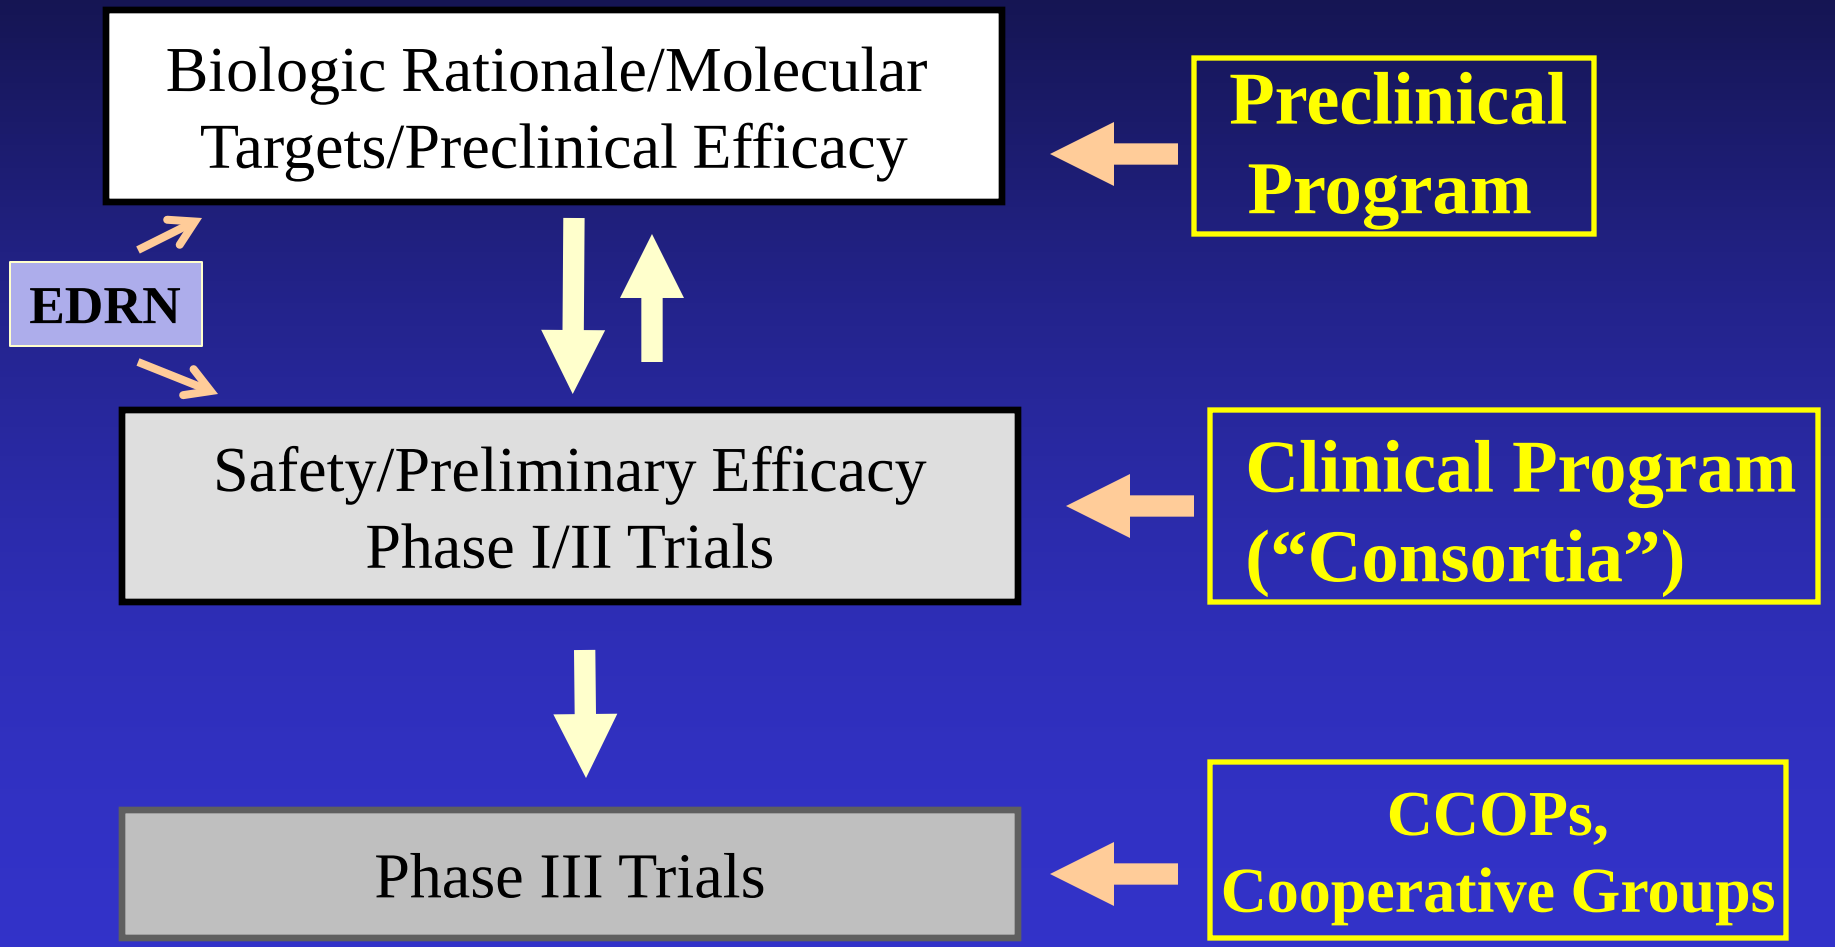


- Minimize toxicities from drug (e.g., route, schedule, modulators of toxicity)

Barriers:

- Lack of adequate risk assessment models for most cancers
- Incomplete understanding of carcinogenesis at different target organs

NCI-DCP Consortia for Early Phase Clinical Trials

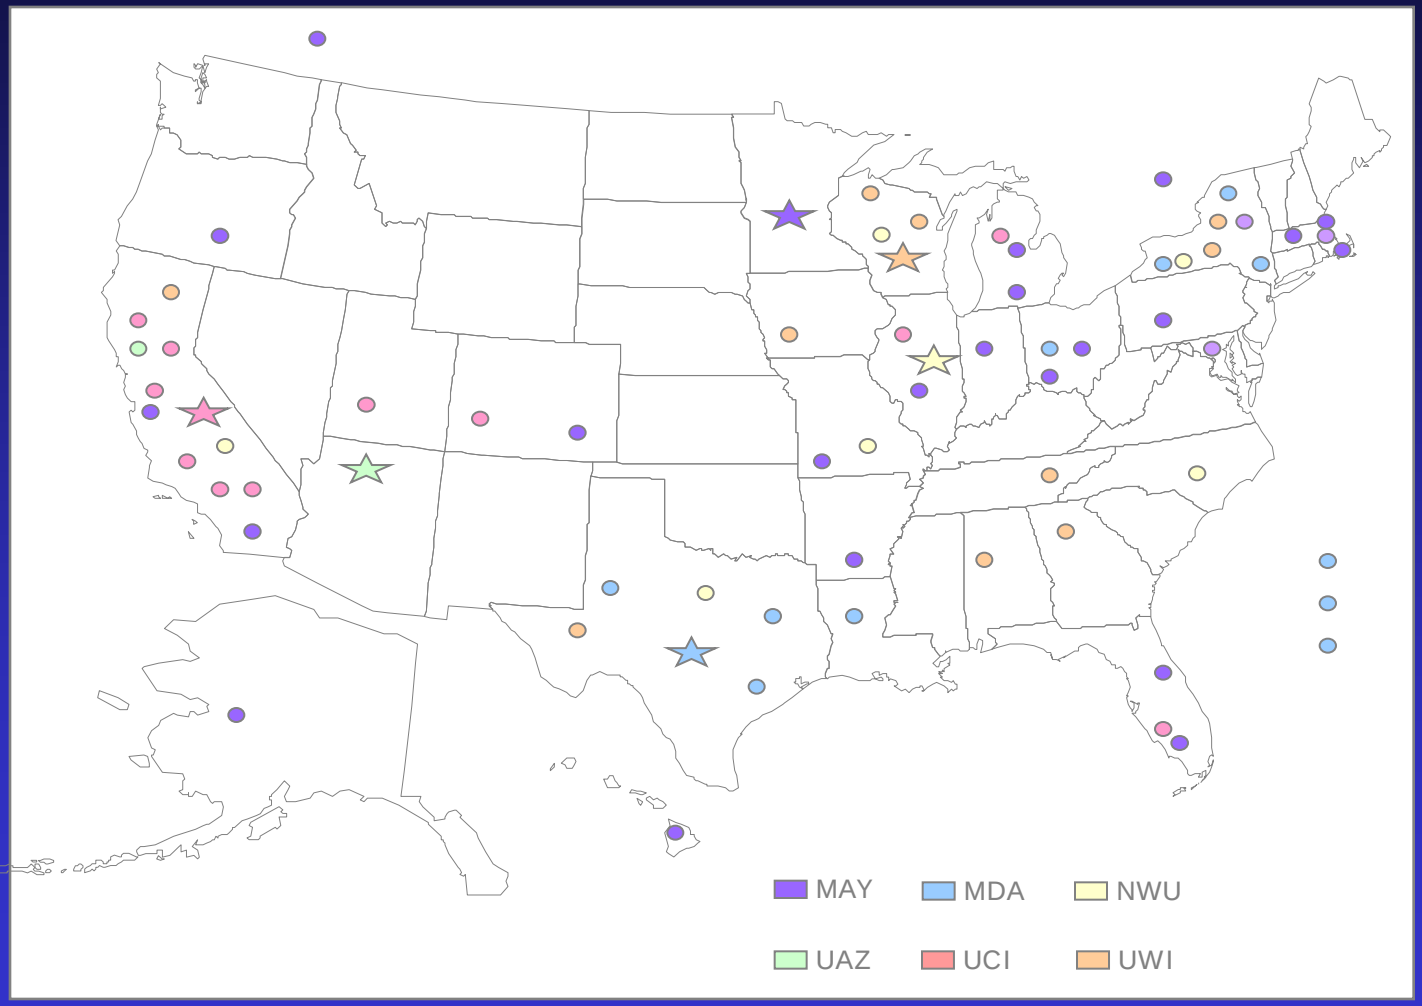


NCI-DCP Consortia for Early Phase Clinical Trials
Objectives

- To qualify cancer preventive agents for further clinical development via the conduct of phase 0, I, & II clinical trials assessing preliminary efficacy and safety

- 2^{o} goals:
  - Optimize clinical trial designs
  - Investigate intermediate endpoint biomarkers

NCI-DCP Consortia for Early Phase Clinical Trials 2003-2011

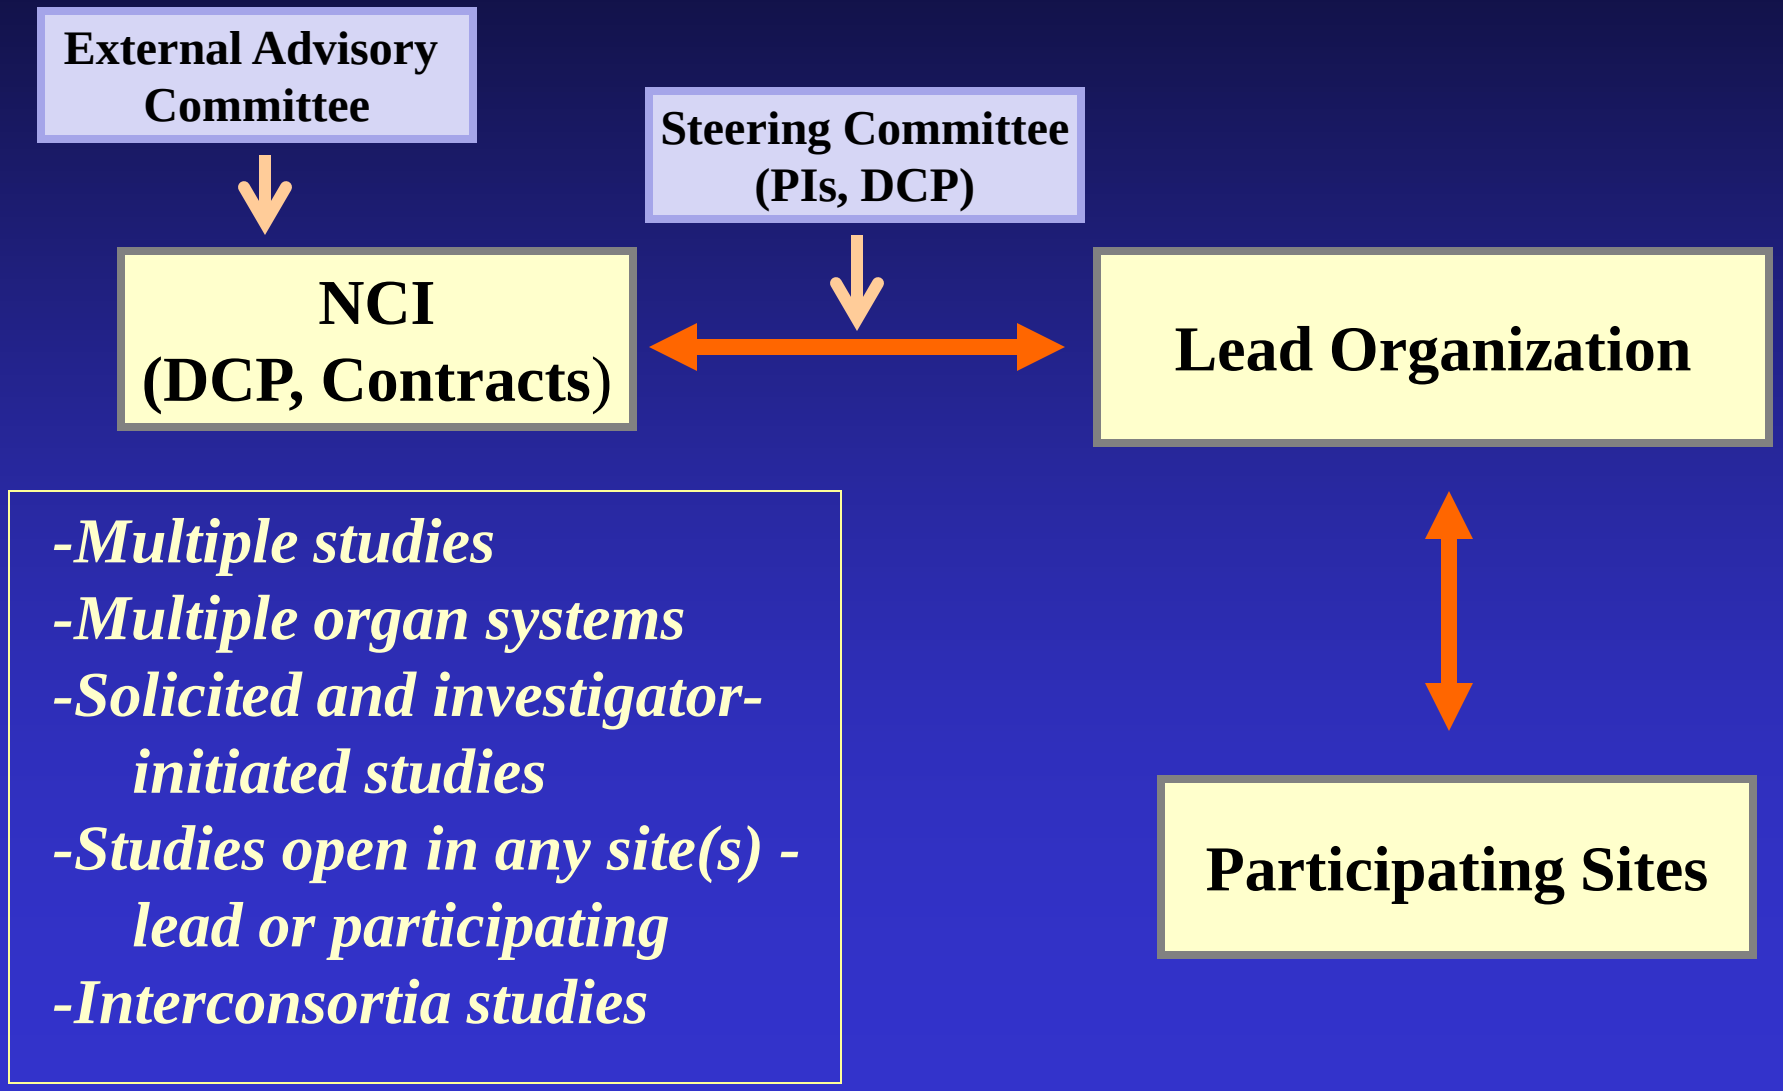


6 contractors
->90 member sites
-perform phase 0, I & II studies

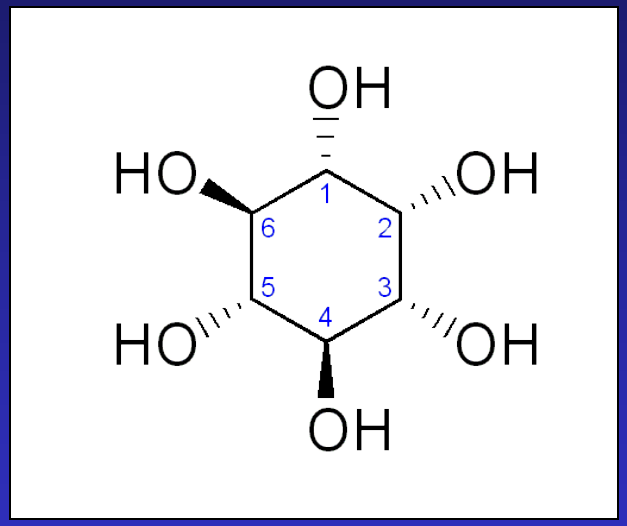
<u>Goals:</u>
-agent testing
-biomarker identification
-clinical trial design optimization

NCI-DCP Consortia for Early Phase Clinical Trials

Structure



myo-Inositol



- Glucose isomer
- Source of several second messengers & signaling molecules
- Dietary sources (grains, beans, fruits, rice)
- Studied in psychiatric conditions (+/-), diabetic neuropathy(+/-), polycystic ovary syndrome (+)

Rationale for *myo*-Inositol in Lung Cancer Prevention

- **Efficacy**
  - **Multiple animal studies show inhibition of carcinogen induced tumors in mice (40-50%)**
    - **Estensen and Wattenberg, Carcinogenesis 1993;14:1975**
    - **Hecht et al., Carcinogenesis 2002;23:1455**
  - **Inhibits carcinogenesis in mainstream/sidestream smoke-exposed A/J mice by 53%**
    - **Witschi H et al., Carcinogenesis 1999;20:1375**
  - **Combination with budesonide ↑↑ efficacy up to 80%**
    - **Estensen and Wattenberg, Carcinogenesis 1993;14:1975**
    - **Witschi et al. Carcinogenesis 1999;20:1375**
    - **Wattenberg et al. Carcinogenesis 2000;21:179**
- **Safety**
  - **Used in multiple short term trials for psychiatric and diabetic neuropathy indications – no toxicity reported**
  - **Generally Regarded as Safe (GRAS) by US FDA terminology**

Phase I Study of *myo*-Inositol in Bronchial Dysplasia

-Lam et al., CEBP 2006;15:1526

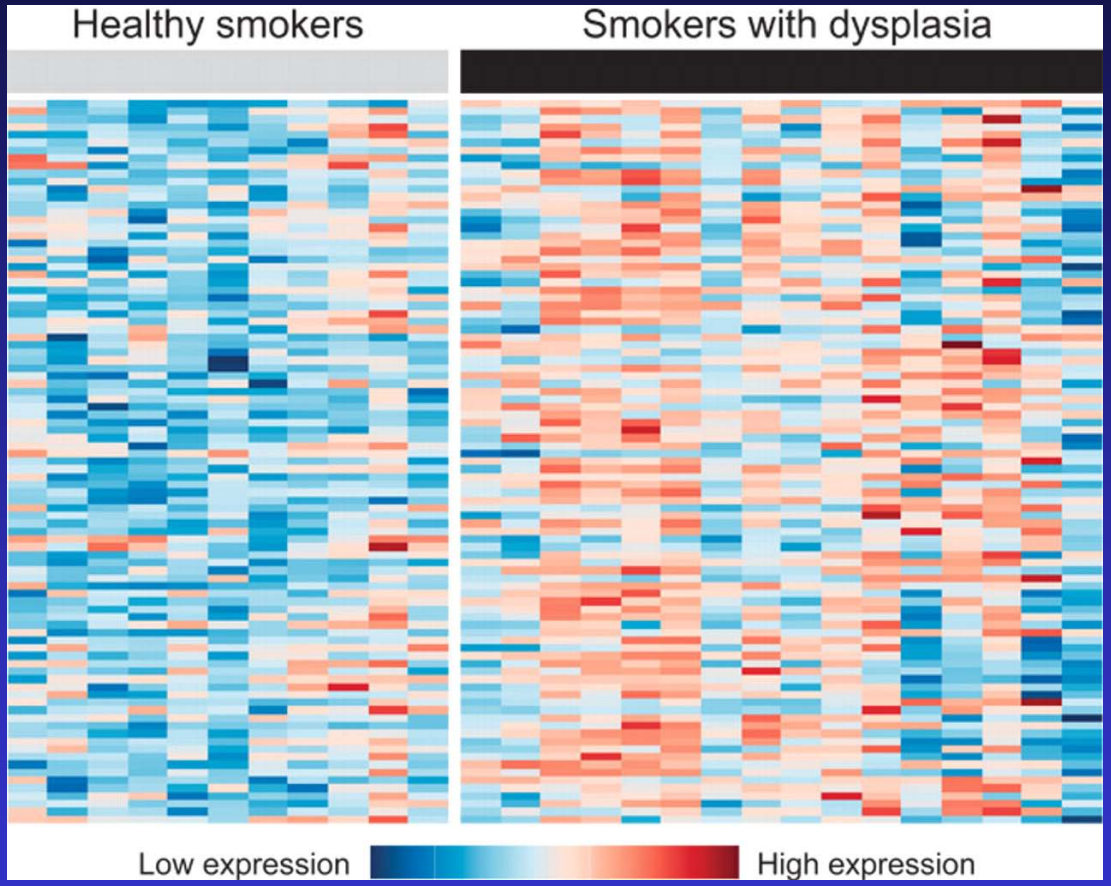
- **Phase I study (26 participants)**
  - **tolerable 18 g/d**
  - **91% vs. 48% regression dysplasia, P=0.014 (10 participants)**
  - BP↓ ~14 mm Hg, independent of meds

Table 5. Changes in pathologic grades of bronchial biopsy samples at baseline and after 3 months of *myo*-inositol (18 g): Lesion-specific analysis

Pathologic grades of bronchial biopsies at baseline	Status after 3 months of treatment			
	N	Stable	Regression*	Progression†
Placebo group (from ref. 18)				
Normal/hyperplasia/metaplasia	256	219	0	37
Mild dysplasia	134	72	62	0
Moderate/severe dysplasia	13	5	8	0
myo-Inositol group				
Normal/hyperplasia/metaplasia	38	36	0	2
Mild dysplasia	10	1	9	0
Moderate/severe dysplasia	1	0	1	0

PI3K pathway activation in the airways of smokers with dysplasia

Gustafson A M et al. Sci Transl Med 2010;2:26ra25



-PI3K pathway is activated in smokers with dysplasia in airway $p<0.001$

-Myo-inositol inhibited PI3K activation in normal bronchial airways in smokers with regression of dysplasia ($p=0.04$)

Why is this study so important?

- **Does PI3K activation truly identify smokers at risk for cancer?**
  - **Easier to get normal brushings than to identify dysplasia (sampling bias); do not remove biomarker with procedure**
  - **Potential to identify "the right" cohort**
- **New potential clinical trial model – pathway analysis pre- and post-treatment, smaller # participants, shorter interventions**
  - **Identify mechanisms of interventions**
  - **Needs validation!**

Potential for Personalized Chemoprevention

Phase IIb *myo*-Inositol Chemoprevention Trial

PI: Stephen Lam, British Columbia Cancer Agency

30+ pack yr. smokers with dysplasia, age ≥45-79
N=110

↓ (Bronch, Spiral CT)

myo-inositol 9g bid vs. placebo x 6 mths

↓ (Bronch, Spiral CT)

1º Endpoint: bronchial dysplasia (# sites/grade)
2º Endpoints: multiple biomarkers (gene expression)

Clinical sites: BCCA, Mayo Clinic, New Mexico VA

Peroxisome Proliferator-Activated Receptor γ (PPAR γ) as a Target for Prevention of Aerodigestive Carcinogenesis

- Pioglitazone – PPARγ agonist approved for type II DM
- Rationale:
  - Cell lines – induces growth arrest, differentiation (NSCLC)
  - Animal carcinogenesis models
    - 4-NQO rat tongue model; incidence and multiplicity ↓ 10-fold
      - Yoshida et al., Cancer Sci 94:365, 2003
  - Epidemiology
    - 33% ↓ lung cancer in diabetics using TZDs (RR=0.67; 95% CI, 0.51-0.87); Nonsignificant decrease in colon and prostate cancer
      - Govindarajan et al. JCO 2007;25:1476-81
    - 41-55%↓ HNSCC in diabetics using TZDs
      - Govindarajan R et al. JCO 2007;25:63s

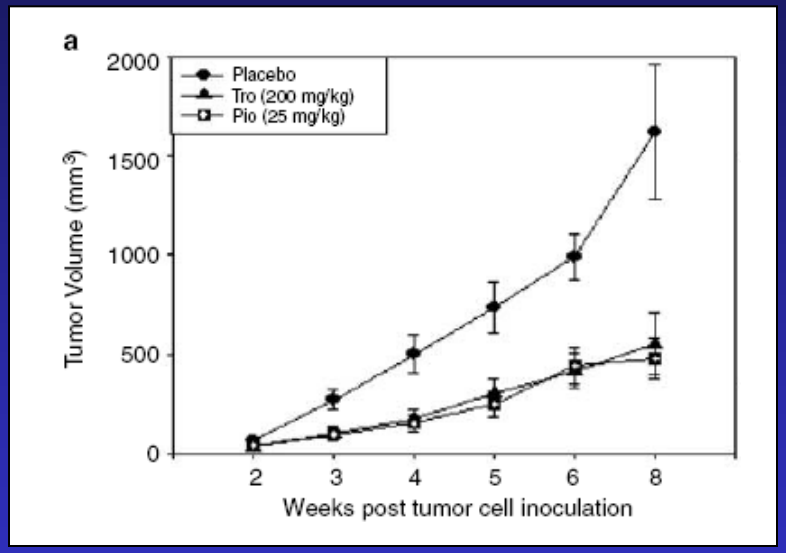
Pioglitazone in Oral Leukoplakia

- DCP phase IIa clinical trial - 22 pts., 81% clinical response rate, 79% average ↓size
  - F. Ondrey, U Minn
    - AACR Frontiers Cancer Prev Res, 2007

pre post

Effect of PPARγ Agonists on NSCLC: Animal Models

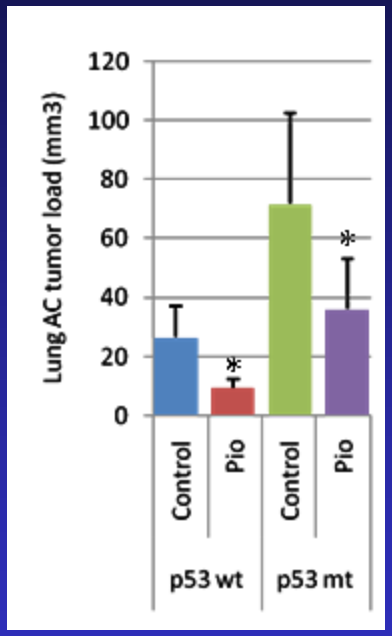
Treatment



-tumor volume ↓ 66.7%
-growth delay 104 days

-Keshamouni et al. Oncogene 2004;23:100-8

Prevention



- Vinyl carbamate-treated mice
  - 56-64% ↓ in tumor burden in wildtype and p53 mutant animals
  - Wang Y et al. Mol Cancer Ther 2010;9:3074-82

Current Pioglitazone Clinical Trials (NCI sponsored)

- Phase IIb oral leukoplakia
  - Pioglitazone 45 mg qd vs placebo x6 months
  - 100 participants; 11 sites
  - 1^{o} Endpoint: clinical and pathologic response
  - PIs: Jay Boyle, MSKCC and Frank Ondrey, UMinn
- Pilot trial presurgical NSCLC trial
  - Pioglitazone 45 mg qd for 2-6 weeks prior to definitive surgery
  - 20 participants; biomarker endpoints
  - PI: Dennis Wigle, Mayo

Novel Agents in Prevention Clinical Trials

Examples

Agent/Agent Class	Target	Organ
metformin	LKB/AMPK	colon, Barrett's, prostate
SR13688	Akt	phase I
UAB30 (rexinoid)	RXRs	phase I
EGF receptor inhibitors	EGFR	lung, colon ACF (dose de-escalation)
myo-inositol	PI3K	lung, colon

Areas of Emphasis for New Consortia

- **Emphasis on:**
  - **Understanding biology of carcinogenesis**
    - **Pilot studies integrating high throughput technologies to understand mechanisms of carcinogenesis and drug action**
    - **New scientific areas – e.g., immunoprevention**
  - **Re-purposing old drugs for prevention; emphasis on drugs affecting multiple chronic diseases**
  - **Intermediate endpoint biomarkers as surrogates for cancer incidence (EDRN)**
  - **Develop and integrate existing risk assessment strategies into trials to identify highest risk populations**
  - **Minimizing toxicity – combinations, alternative delivery schedules (e.g., pulsatile treatment), regional drug delivery**
  - **Biorepository**
