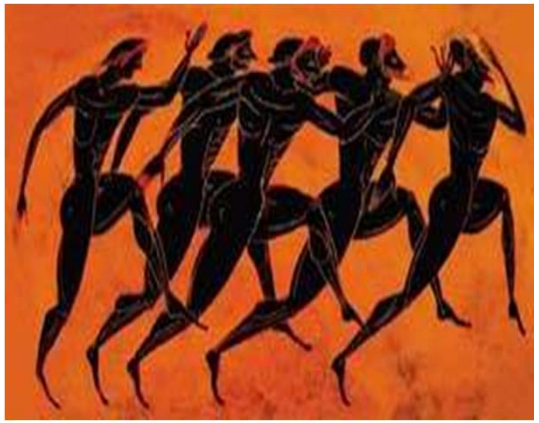
TREC Transdisciplinary Research on Energetics and Cancer Centers

Cancer risk and metabolic disease

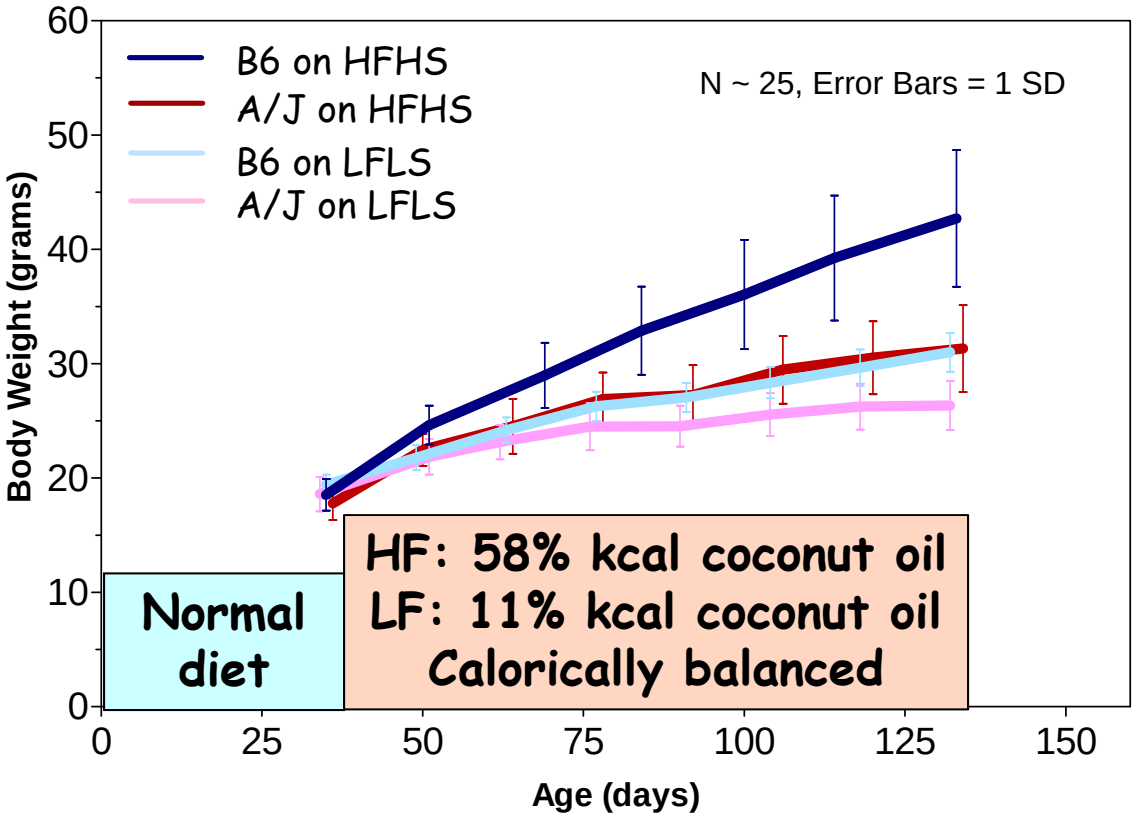
+

and



=

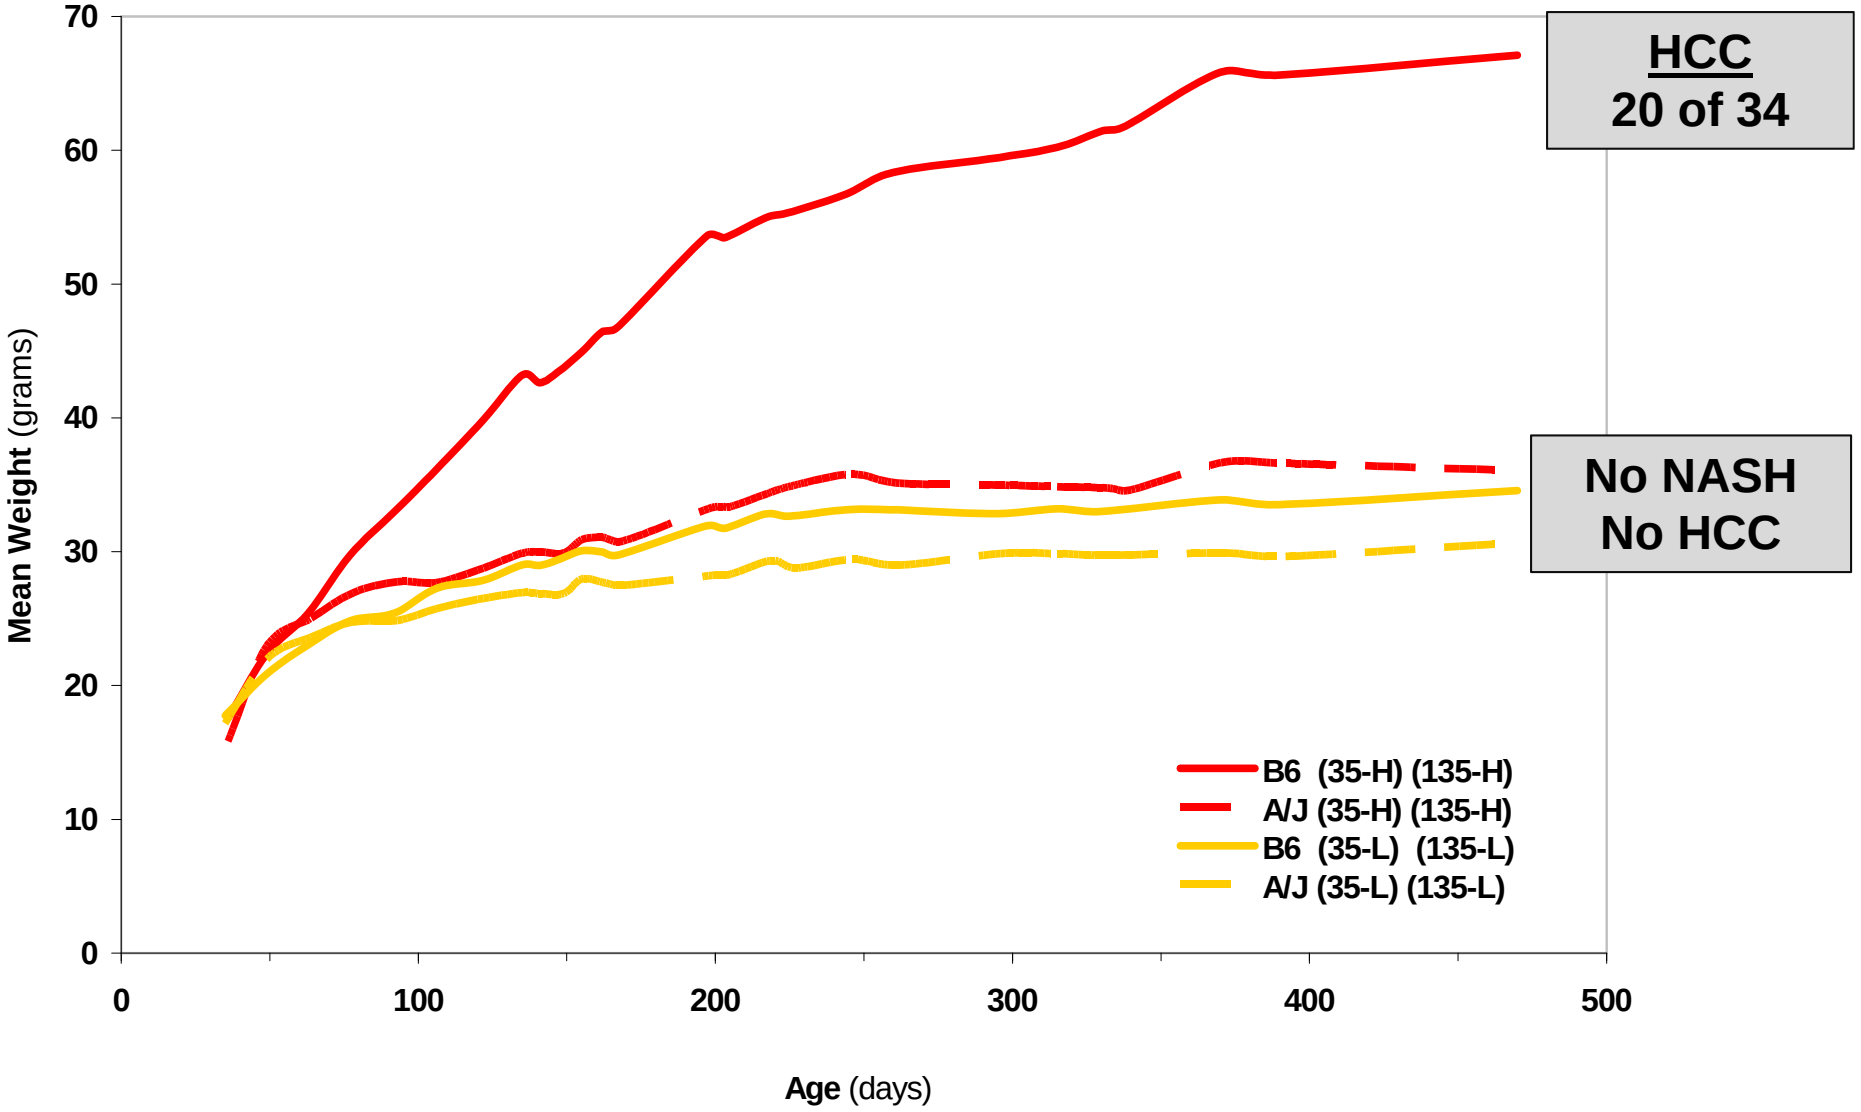
Diet-induced obesity: Gene - diet interactions

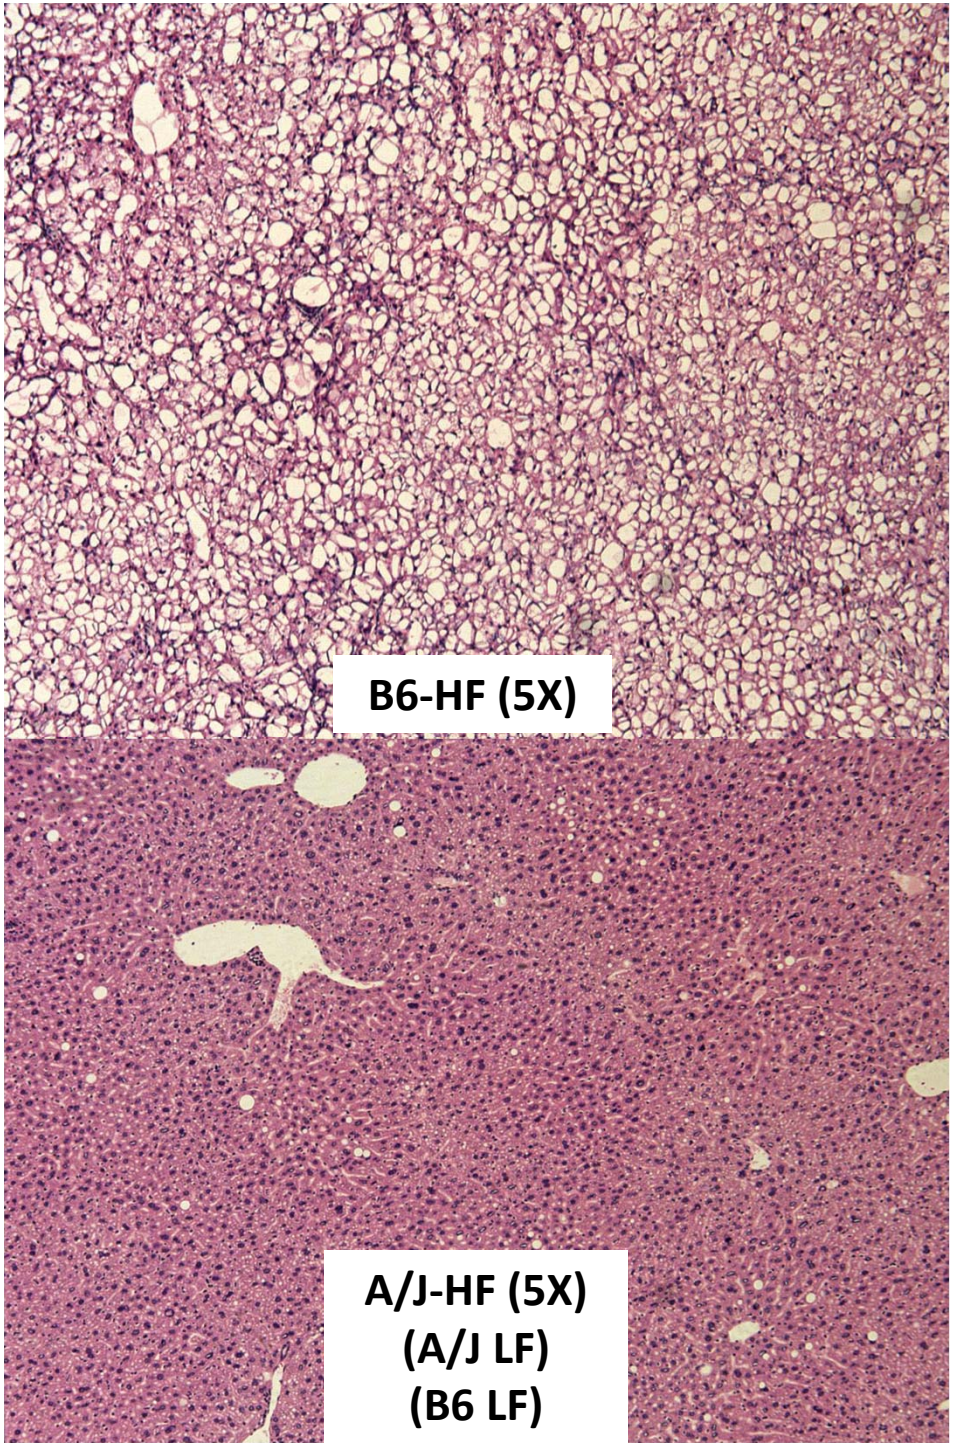


B6 - obese only with a HFHS diet

A/J - lean regardless of diet

Long-term effects of high fat diet





Non-alcoholic steatohepatitis (NASH) in B6 but not A/J mice

-steatosis

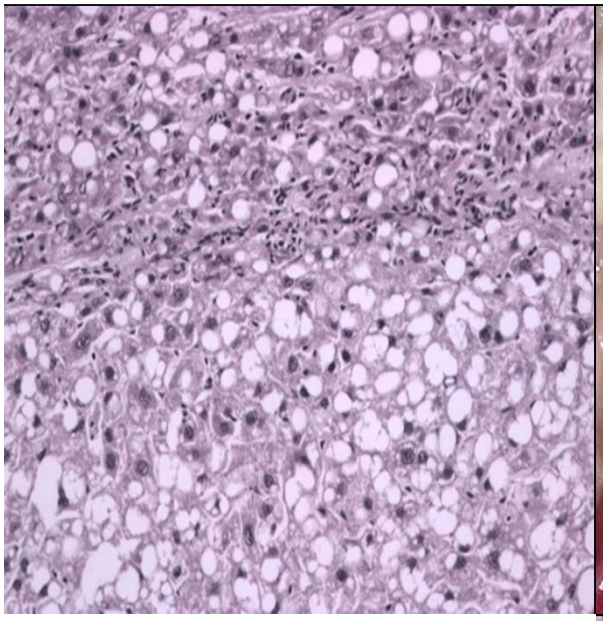
(40% of liver mass is lipid)

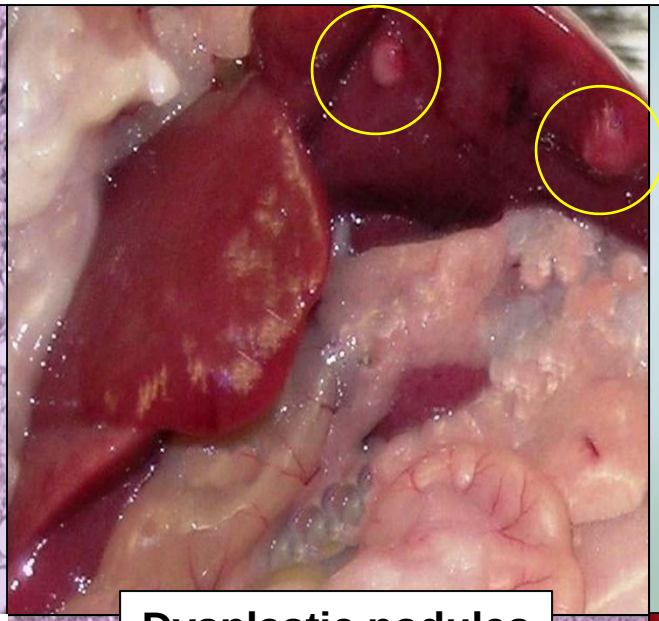
after 100 days on high fat, but not low fat diet

- hepatitis (inflammation)
- fibrosis
- limited cirrhosis

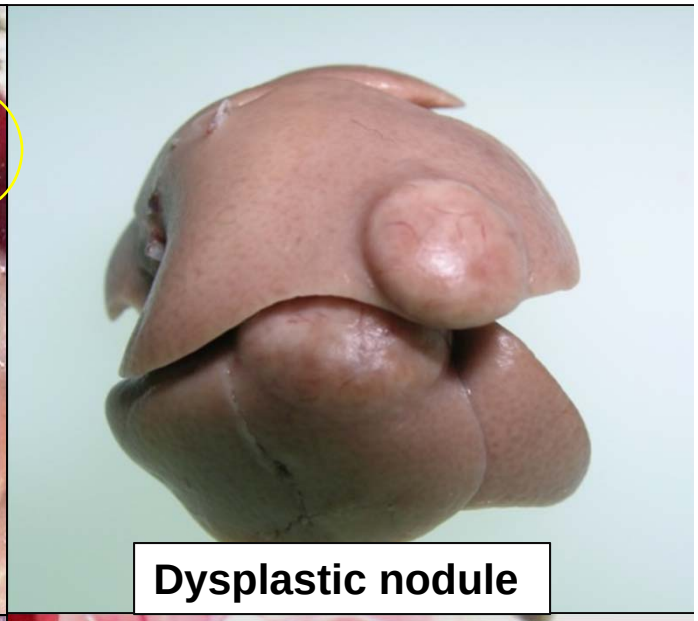
after 400 days

Diet-induced malignant transformation and hepatocellular carcinoma (HCC)



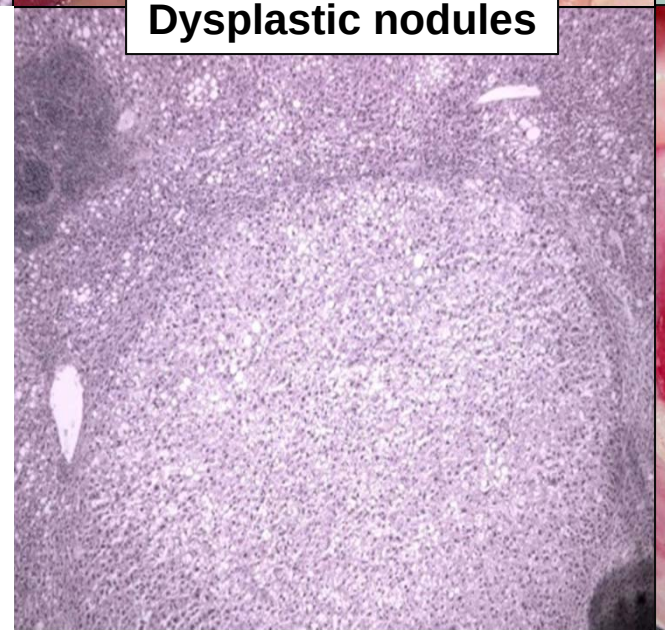


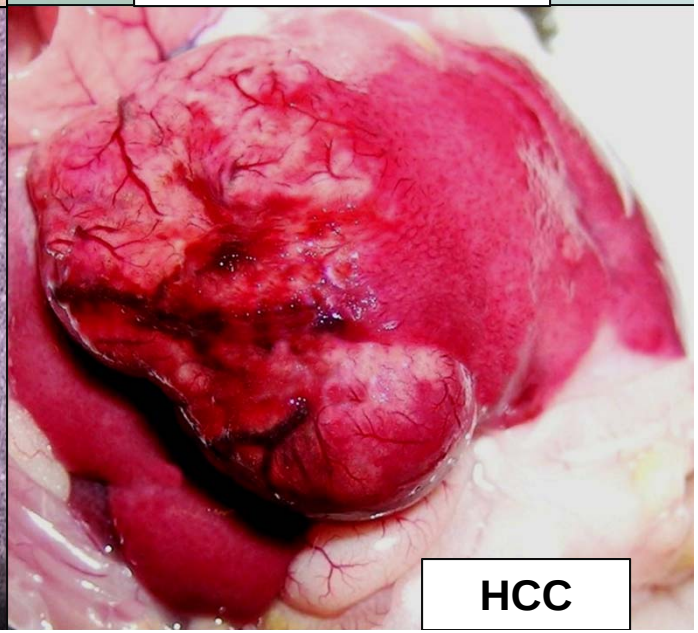
Dysplastic nodules



Dysplastic nodule

Cycles of cell damage, death and regeneration eventually lead to transformation, NASH - the '*fertile soil*' in which transformation occurs





HCC

Hepatocellular carcinoma (HCC)

- 3rd most common cause of cancer death worldwide
- Rapidly growing cause of cancer death in U.S.
- Risk factors:
  1. Hepatitis B or C
  2. Chronic alcohol use

  } ~70% of cases (Ken Tanabe, MGH personal communication)

- Remaining 30% of "unexplained" cases are frequently associated with obesity, diabetes, non-alcoholic steatohepatitis

HCCs in humans and mice

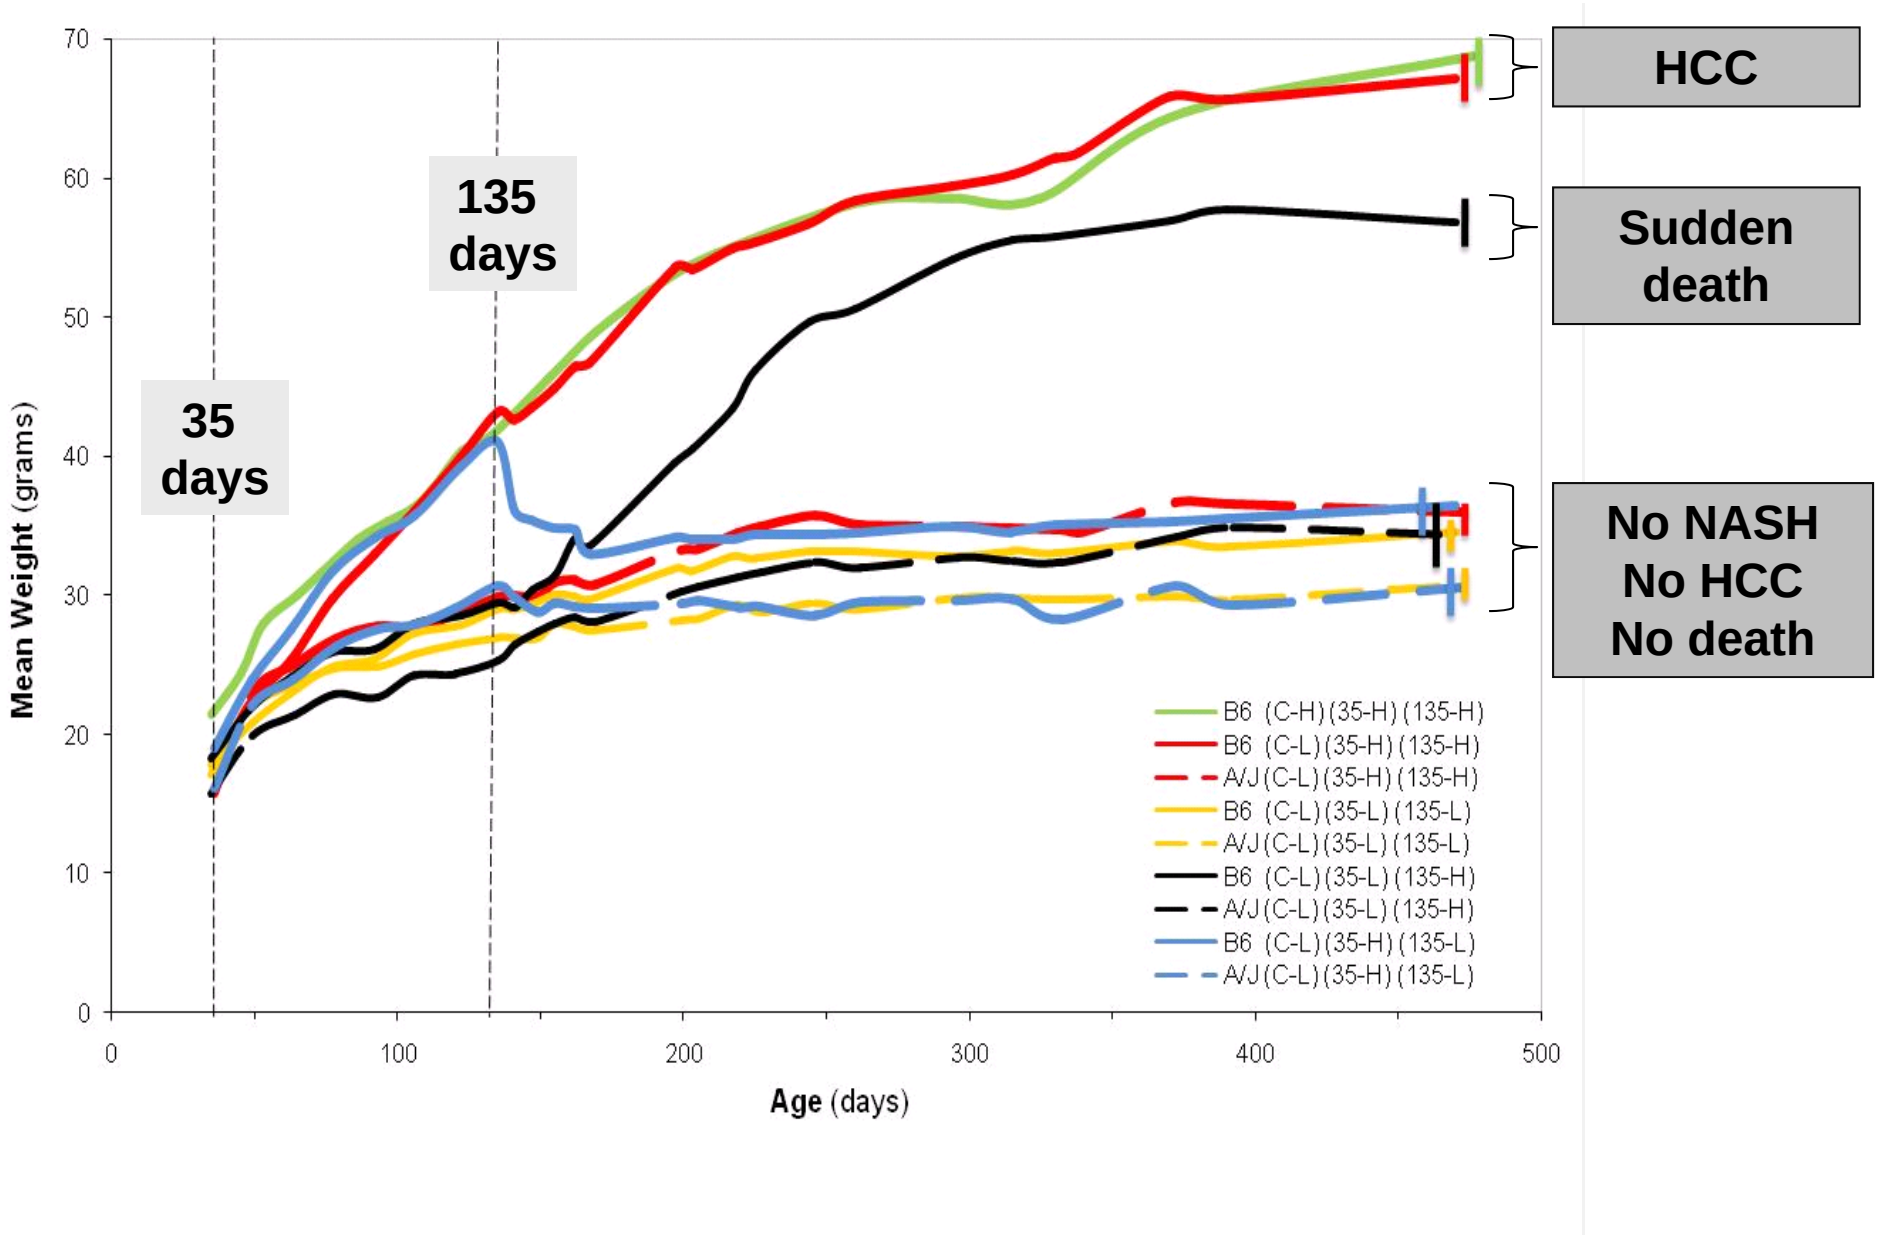
1. Biochemistry
2. Histology
3. mRNA profiles

} **Similar features in humans and mice**

1. Molecular pathways (Myc and NFkB)
2. miRNA profiles (X-linked cluster)
3. Predicted mRNA targets of miRNAs

Liver necrosis, cell death
Liver steatosis
Liver proliferation
Hepatocellular carcinoma
Cardiac degeneration, cell death

Diet-switch prevents HCC



Metabolic Syndrome, NASH, HCC

On High Fat, High Sucrose Diet:	 B6	 A/J
Obesity	✓	X
Hypertension	✓	X
Insulin Resistance	✓	X
Cardiovascular Disease Risk	✓	X
Non-alcoholic steatohepatitis	✓	X
Hepatocellular carcinoma	✓	X
	Genetics of disease	Genetics of health

J. Nadeau and E. Topol, Nat. Genet. 2006; Shao et al. PNAS; JHN et al, in prep

HCC summary

Diet-induced, rather than genetically-engineered or carcinogen-induced

Similar pathology and molecular features

Two pathways in one strain on the same diet

Diet switch reverses outcome

A similar diet modification may have important implications for prevention of HCCs in humans

HCC questions

Genetic control of susceptibility
chromosome substitution strains
(*Singer et al. Science 2004, Shao et al. PNAS 2008*)

Mechanisms of transformation
engineered mutant genes and alternative fats

Diet switch effects
physiological mechanisms

Interventions
drugs and diets
