### Performance and Optimization of LC-MS/MS Platforms for Unbiased Discovery of Biomarker Candidates

Daniel C. Liebler

Vanderbilt University School of Medicine Vanderbilt, Tennessee

#### A Functioning Pipeline for Cancer Biomarker Development Requires Both Discovery and Directed Assay Components

CLINICAL PROTEOMIC

## Shotgun proteomics for biomarker discovery

•few (<20) samples or sample pools

low throughput

•Identify ~5,000+ proteins

•inventory differences ~50-500+ proteins

#### Challenges

 > 10<sup>6</sup> range of protein concentrations in tissues, biofluids

CLINICAL PROTEOM

- no technology yet capable of complete sampling of proteomes
- multiple instrument systems used
- variability in detection of proteins

No systematic studies of variation in shotgun proteomics Impact of variation on performance for unbiased discovery unknown

#### **HUPO Study**

"A HUPO test sample study reveals common problems in mass spectrometry-based proteomics" *Bell et al. Nature Methods (2009)* **6**: 423-430

20 protein mixture distributed to 27 labs; no standardized methods or data analysis

only 7 labs correctly ID all 20 proteins

Coaching  $\rightarrow$  reanalyses  $\rightarrow$  common bioinformatics

• all 27 labs correctly ID "most" proteins

**Conclusions:** 

- Variable performance within and between labs
- better databases and search engines needed, as is training in their use

Key questions not addressed:

- Is the technology inherently variable?
- What are the sources of variation?
- How reproducible are analyses of complex biological proteomes?

#### **CPTAC Unbiased Discovery Workgroup: Goals**

Evaluate and standardize performance of proteomic *discovery* platforms and standardize their use

- Identify and characterize sources of variation
- Develop quality control metrics
- Employ defined protein mixtures and biologically relevant proteomes
- Evaluate sensitivity for protein detection at defined levels of concentration

#### **CPTAC Discovery WG studies: from simple to complex proteomes**

## Repeatability and reproducibility are robust across laboratories

CLINICAL PROTEOMIC

# Saccharomyces cerevisiae proteome reference material

- Complex protein matrix (6,000 ORFs)
- Reproducible preparation possible
- Quantitative TAP tag studies (Ghaemmaghami, S. et al. (2003) Nature 425, 737-741) provide calibration for expression levels
- Statistical power for modeling depth of coverage by proteomics platforms
- Use with human protein spikes enables modeling for biomarker discovery applications
- Made available to proteomics community (NIST)

Ghaemmaghami, S. et al. (2003) Nature 425, 737-741

#### Modeling detection of human protein "biomarker" spikes in yeast matrix

•48 human protein (UPS) spikes in yeast proteome background

CLINICAL PROTEOMIC

•"simple" discovery system distinguishes differences equivalent to 0.5 – 1.3% of proteome

Case Sample	# identified biomarkers <sup>b</sup>	# true positives <sup>c</sup>	# true negatives <sup>d</sup>	# false positives <sup>e</sup>	# false negatives <sup>f</sup>	Sensitivity <sup>g</sup>	Specificity <sup>h</sup>
Study 6 SOP (yeast+ 0.25 fmol / ul UPS)	0	0	2522	0	48	0.0	1.0
Study 6 SOP (yeast+ 0.74 fmol / ul UPS)	3	3	2522	0	45	0.1	1.0
Study 6 SOP (yeast+ 2.2 fmol / ul UPS)	17	17	2522	0	31	0.4	1.0
Study 6 SOP (yeast+ 6.7 fmol / ul UPS)	32	32	2522	0	16	0.7	1.0
Study 6 SOP (yeast+ 20 fmol / ul UPS)	43	41	2520	2	7	0.9	1.0

Spike concentration (fmol/ul)

CLINICAL PROTEOMIC TECHNOLOGIES FOR CANCER

**CPTAC** study 5

#### **CPTAC Unbiased Discovery Workgroup: Key Achievements**

- 1. First systematic, SOP-driven study of LC-MS/MS analytical systems across multiple laboratories
- 2. Quantitative assessment of repeatability and reproducibility in peptide vs. protein detection
- 3. Yeast reference proteome standard and accompanying datasets
- 4. Yeast reference proteome with spikes enables quantitative modeling of power to discover biomarker candidates
- 5. Performance metrics and software ("toolkit") to monitor and troubleshoot system performance

#### **Next steps for Discovery WG**

### Evaluate performance of platforms to discriminate between cancer-relevant phenotypes

- Phase II Studies
  - Human breast cancer cell model; responses to TKI
  - Compare commonly employed quantitative methods for survey of differences
- Phase III studies
  - Human tumor tissue specimens corresponding to defined clinical phenotypes
    - Evaluate phenotype discrimination
    - Implement methods, metrics and approaches developed in Phase I, Phase II studies

### Backups

# Why care about reproducibility in discovery proteomics?

 Biomarker candidates come from comparing proteomes from different phenotypes

CLINICAL PROTEOMIC

2. Need to know whether observed differences are due to biology or to variability in the analytical system.

### Yeast proteome enables calibration and comparison of detection efficiency

a. Study 8 high load
