T cells as a Drug for the Personalized Immunotherapy of Cancer

BSA/NCAB Meeting

June 26, 2018

Steven A. Rosenberg, M.D., PhD.
Surgery Branch, National Cancer Institute

Major Challenge Confronting Cancer Immunotherapy

The development of effective immunotherapies for patients with metastatic epithelial solid cancers that result in over 80% of cancer deaths.

ADVANTAGES OF CELL TRANSFER THERAPY

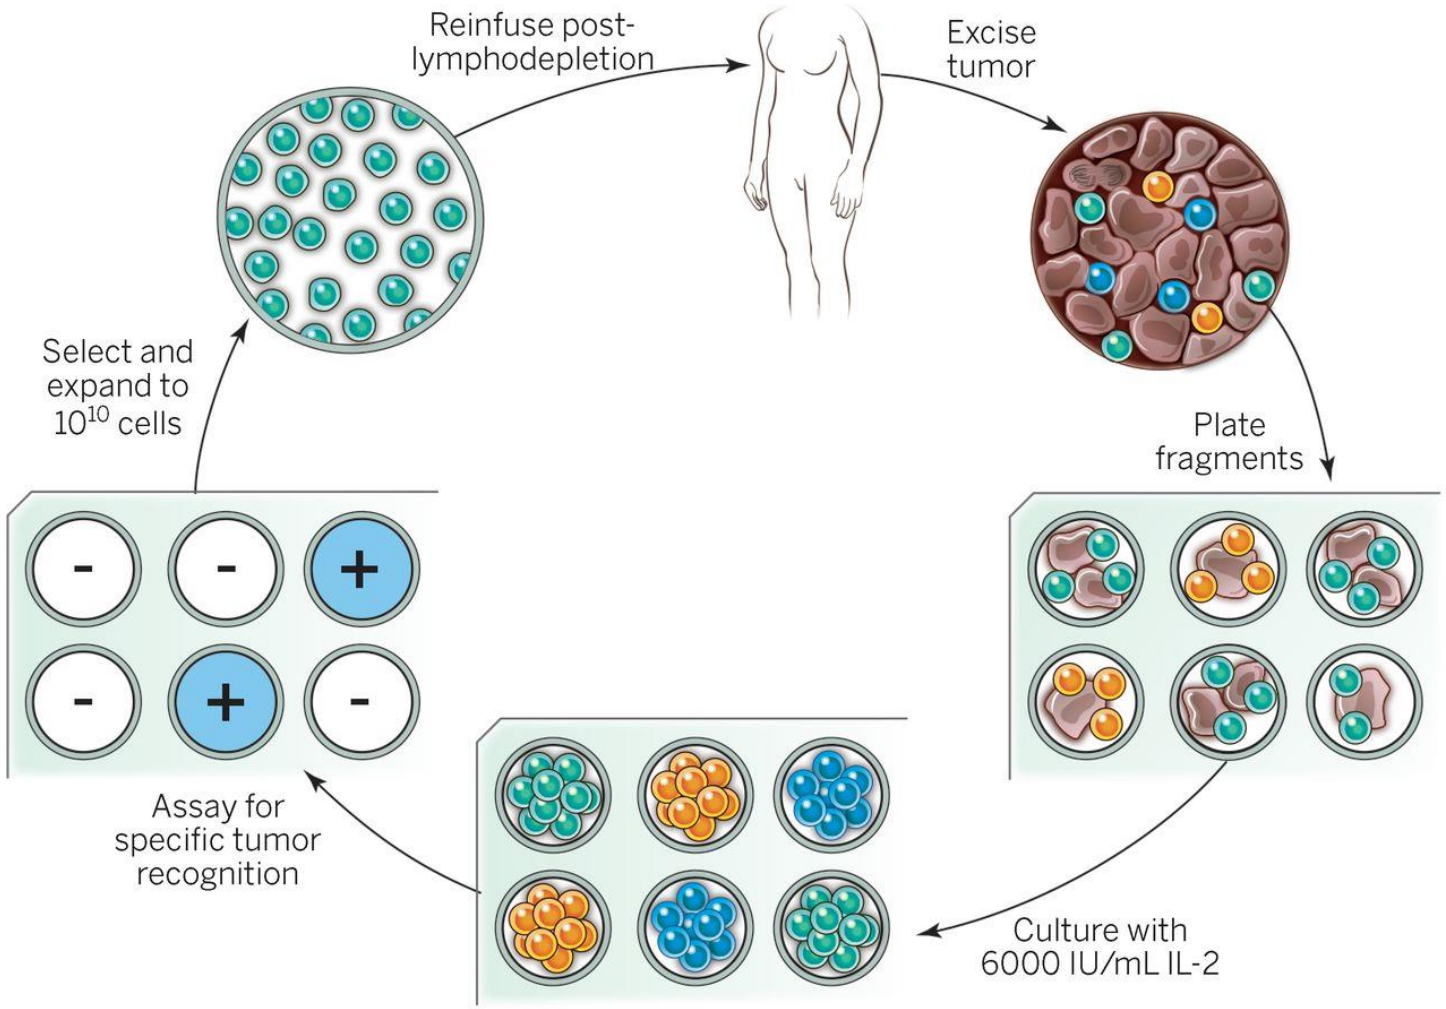
1. Administer large numbers of highly selected cells with high avidity for tumor antigens.

2. Administer cells activated ex-vivo to exhibit anti-tumor effector function.

3. Potentially identify exact cell subpopulations and effector functions required for cancer regression in vivo.

4. Manipulate host prior to cell transfer to provide altered environment for transferred cells.

Adoptive cell therapy (ACT) using tumor-infiltrating lymphocytes (TIL)



Summary of Cell Transfer Protocols for the Treatment of Patients with Metastatic Melanoma* (median f/u 6.3 years)

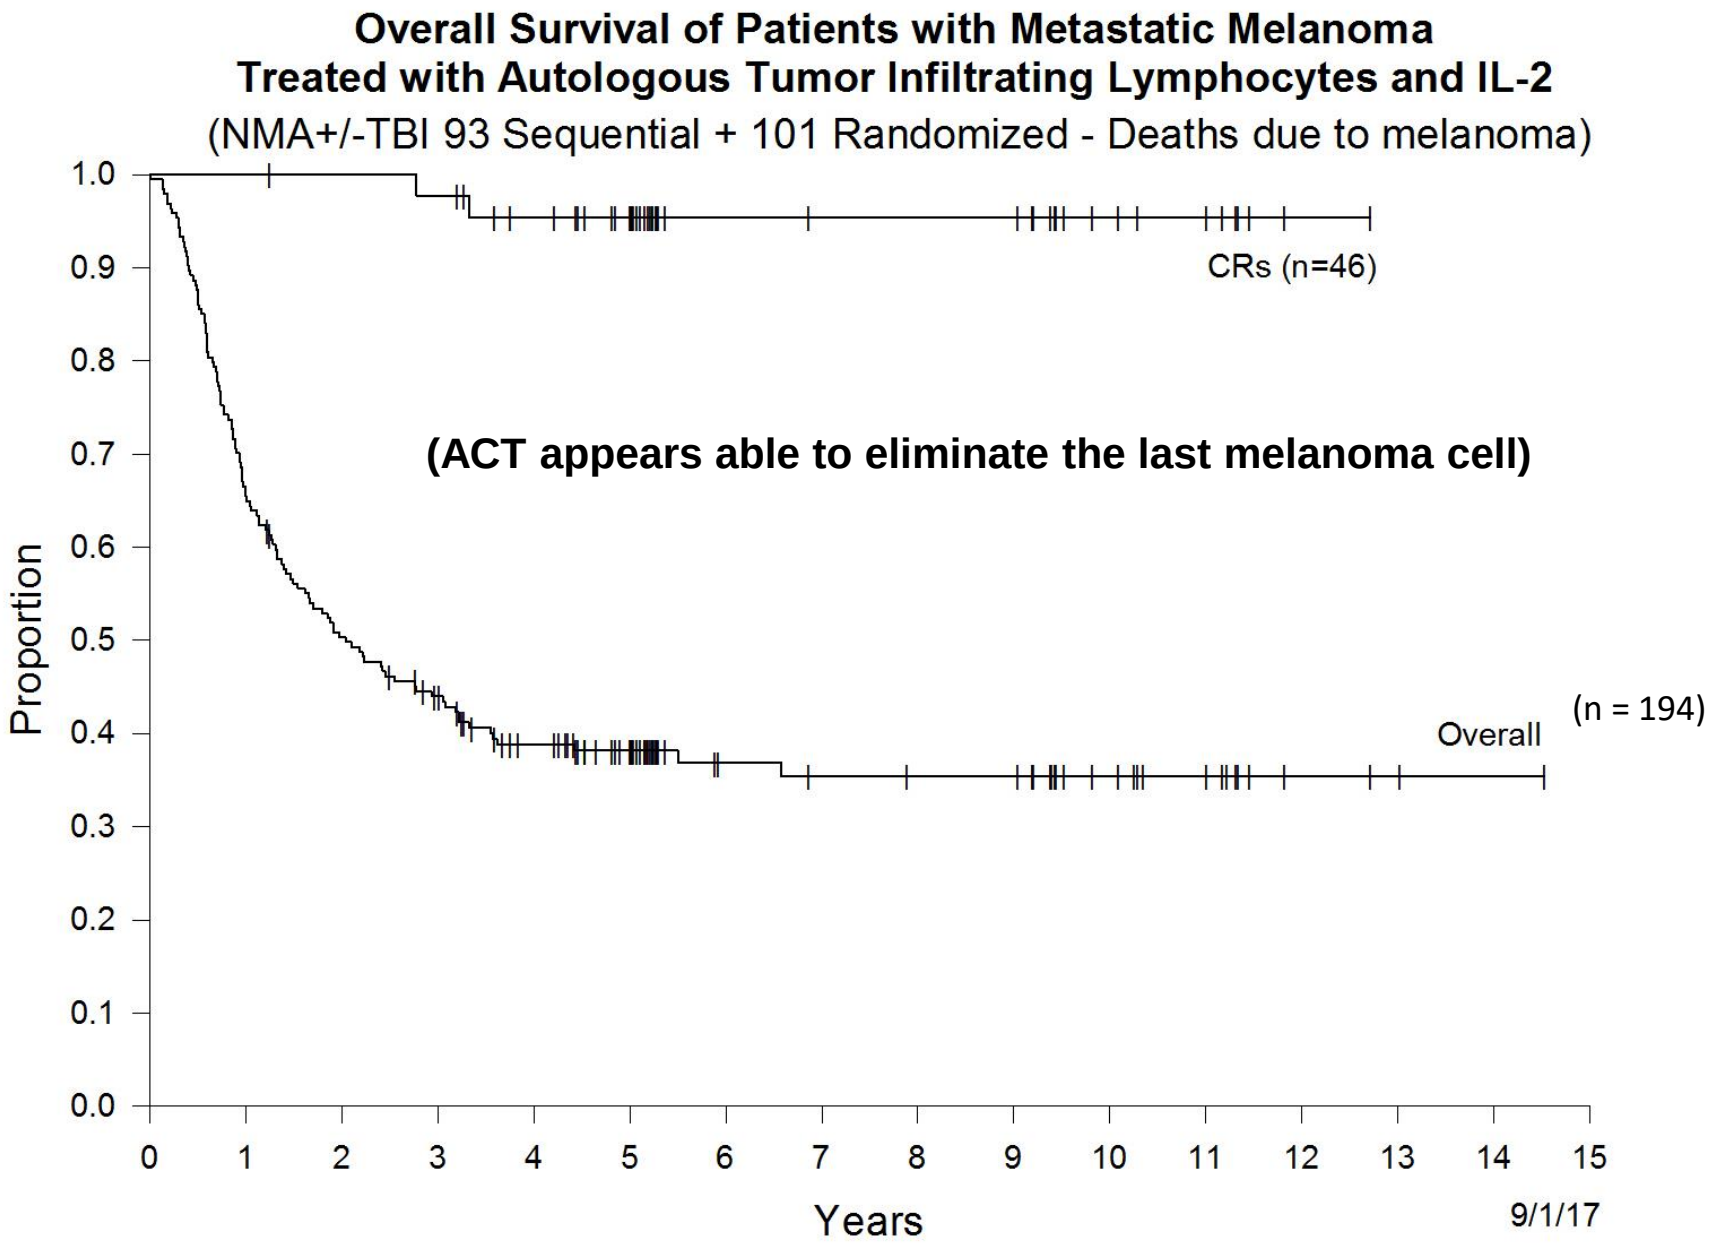
(44 of 46 Complete Responders received a single treatment)



(Median followup: 6.3 years)

Question

What do TIL recognize that enables the in vivo destruction of the last melanoma cell?

(Specific cancer regression in the absence of off-tumor on-target, toxicities in patients led us to explore the role of specific cancer mutations as the targets of TIL.)

Mining the Cancer Exome to Identify Immunogenic Cancer Mutations

---

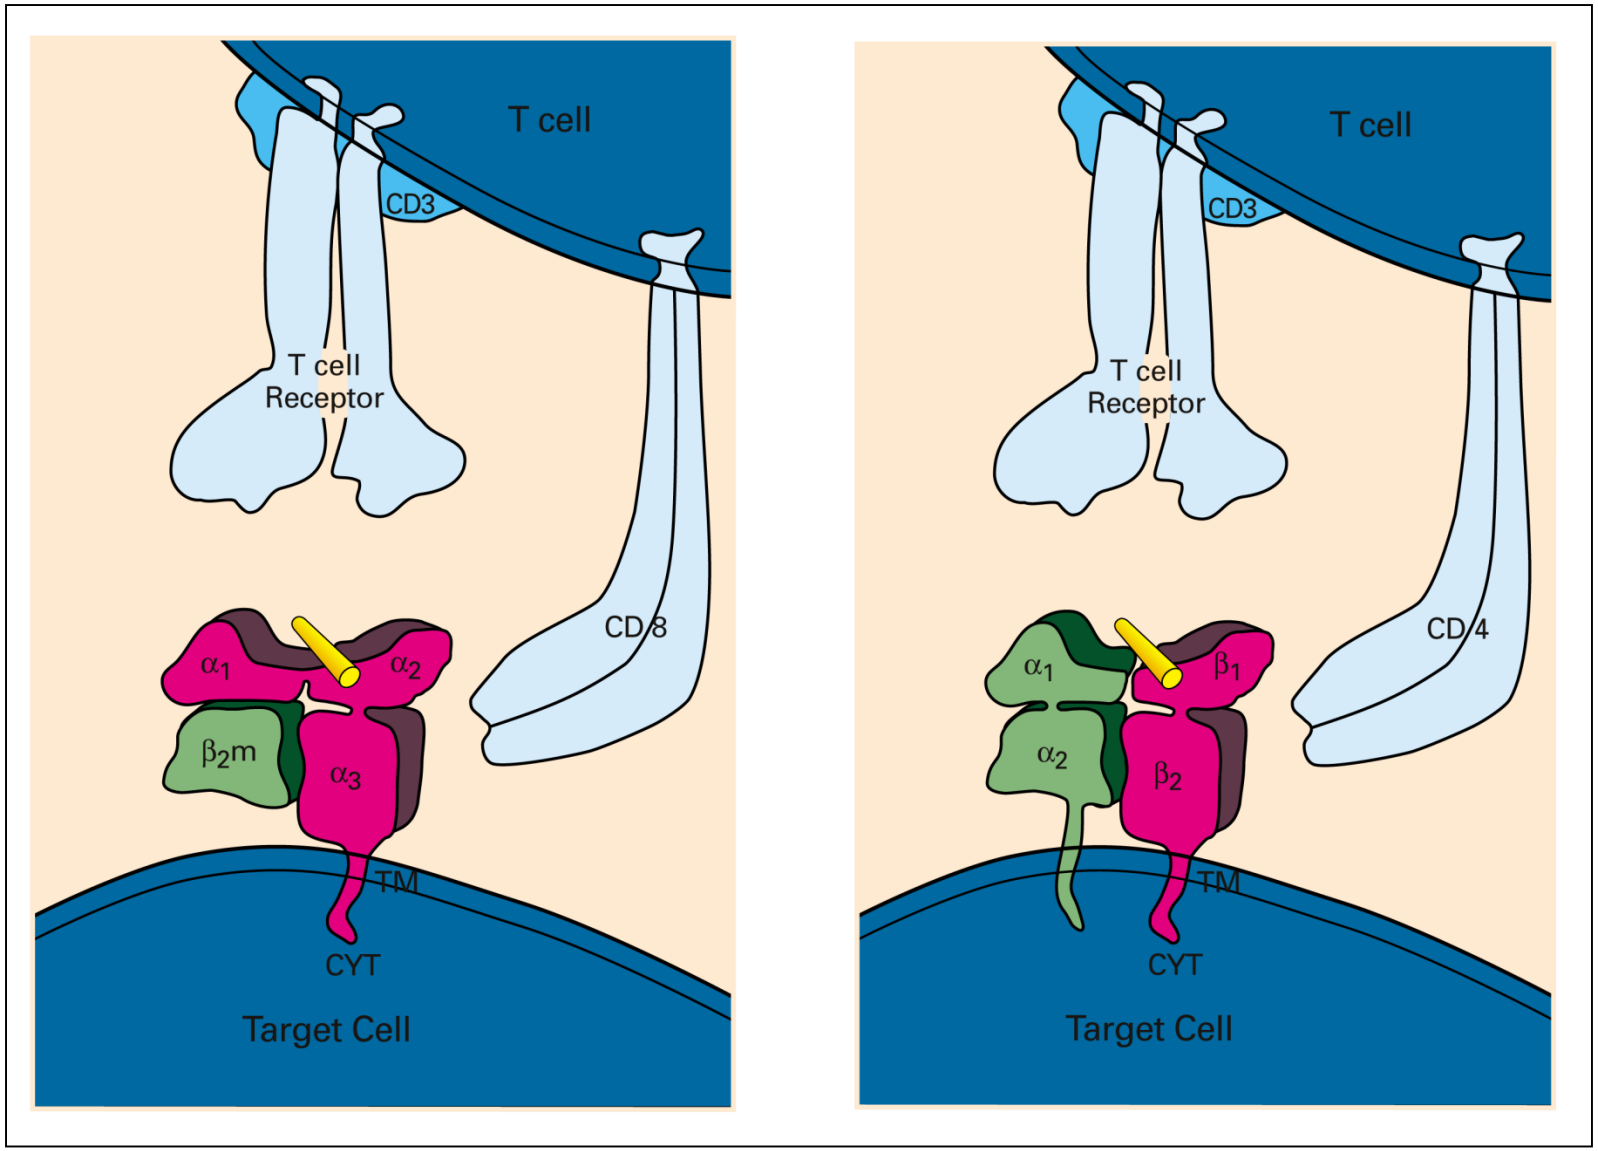
For a mutation to be a cancer antigen it has to:

1) be processed intracellularly into a 9-11 amino acid peptide

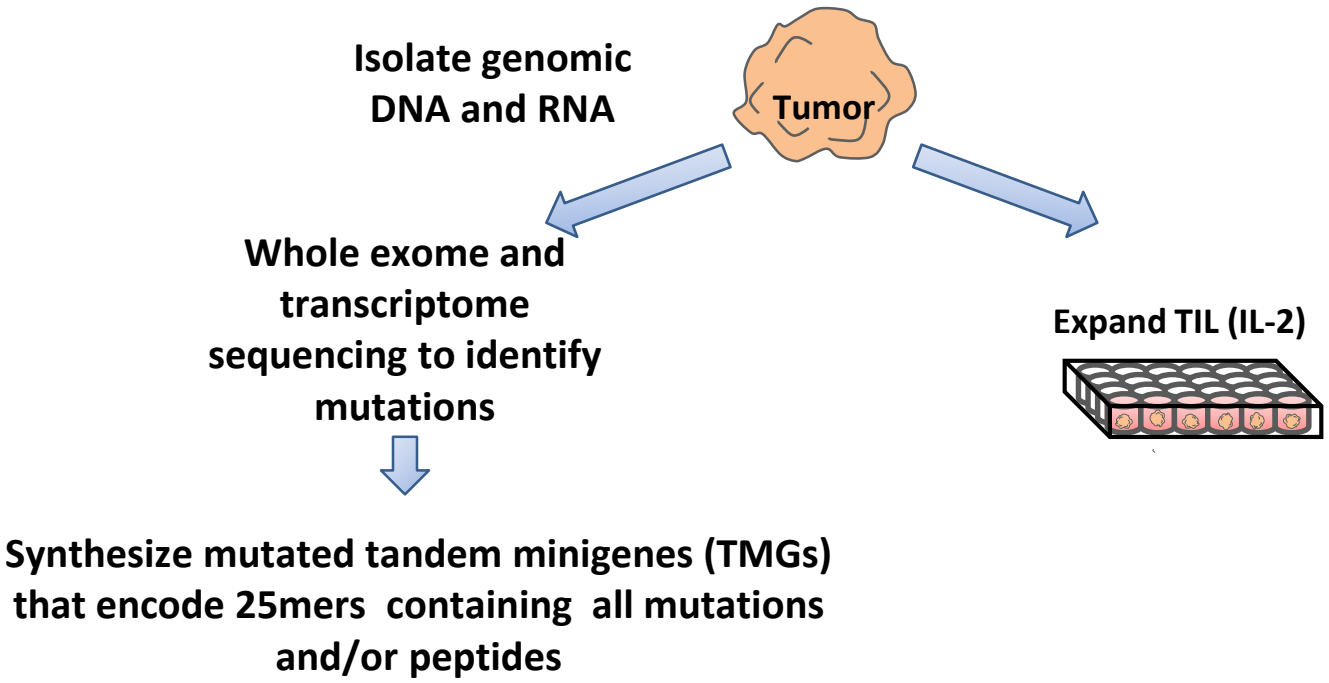
2) the peptide must fit and be presented in the groove of on one of the patient's surface MHC molecules

Thus, only rare mutations will be antigenic.

Antigen recognition by $CD4^+$ and $CD8^+$ T lymphocytes



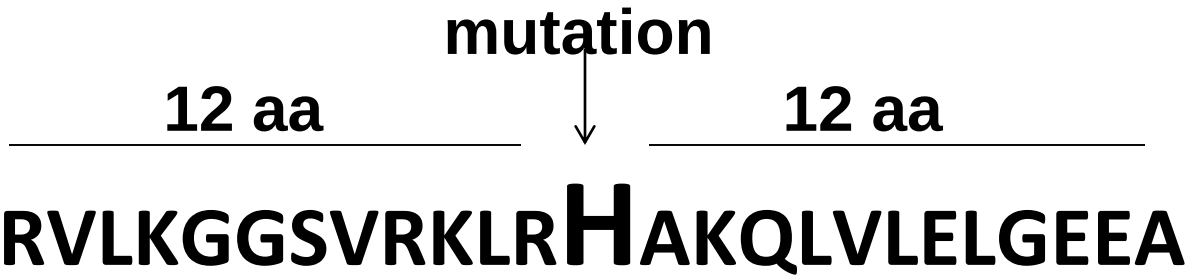
Blueprint for the generation of mutation-reactive T-cells in common cancers



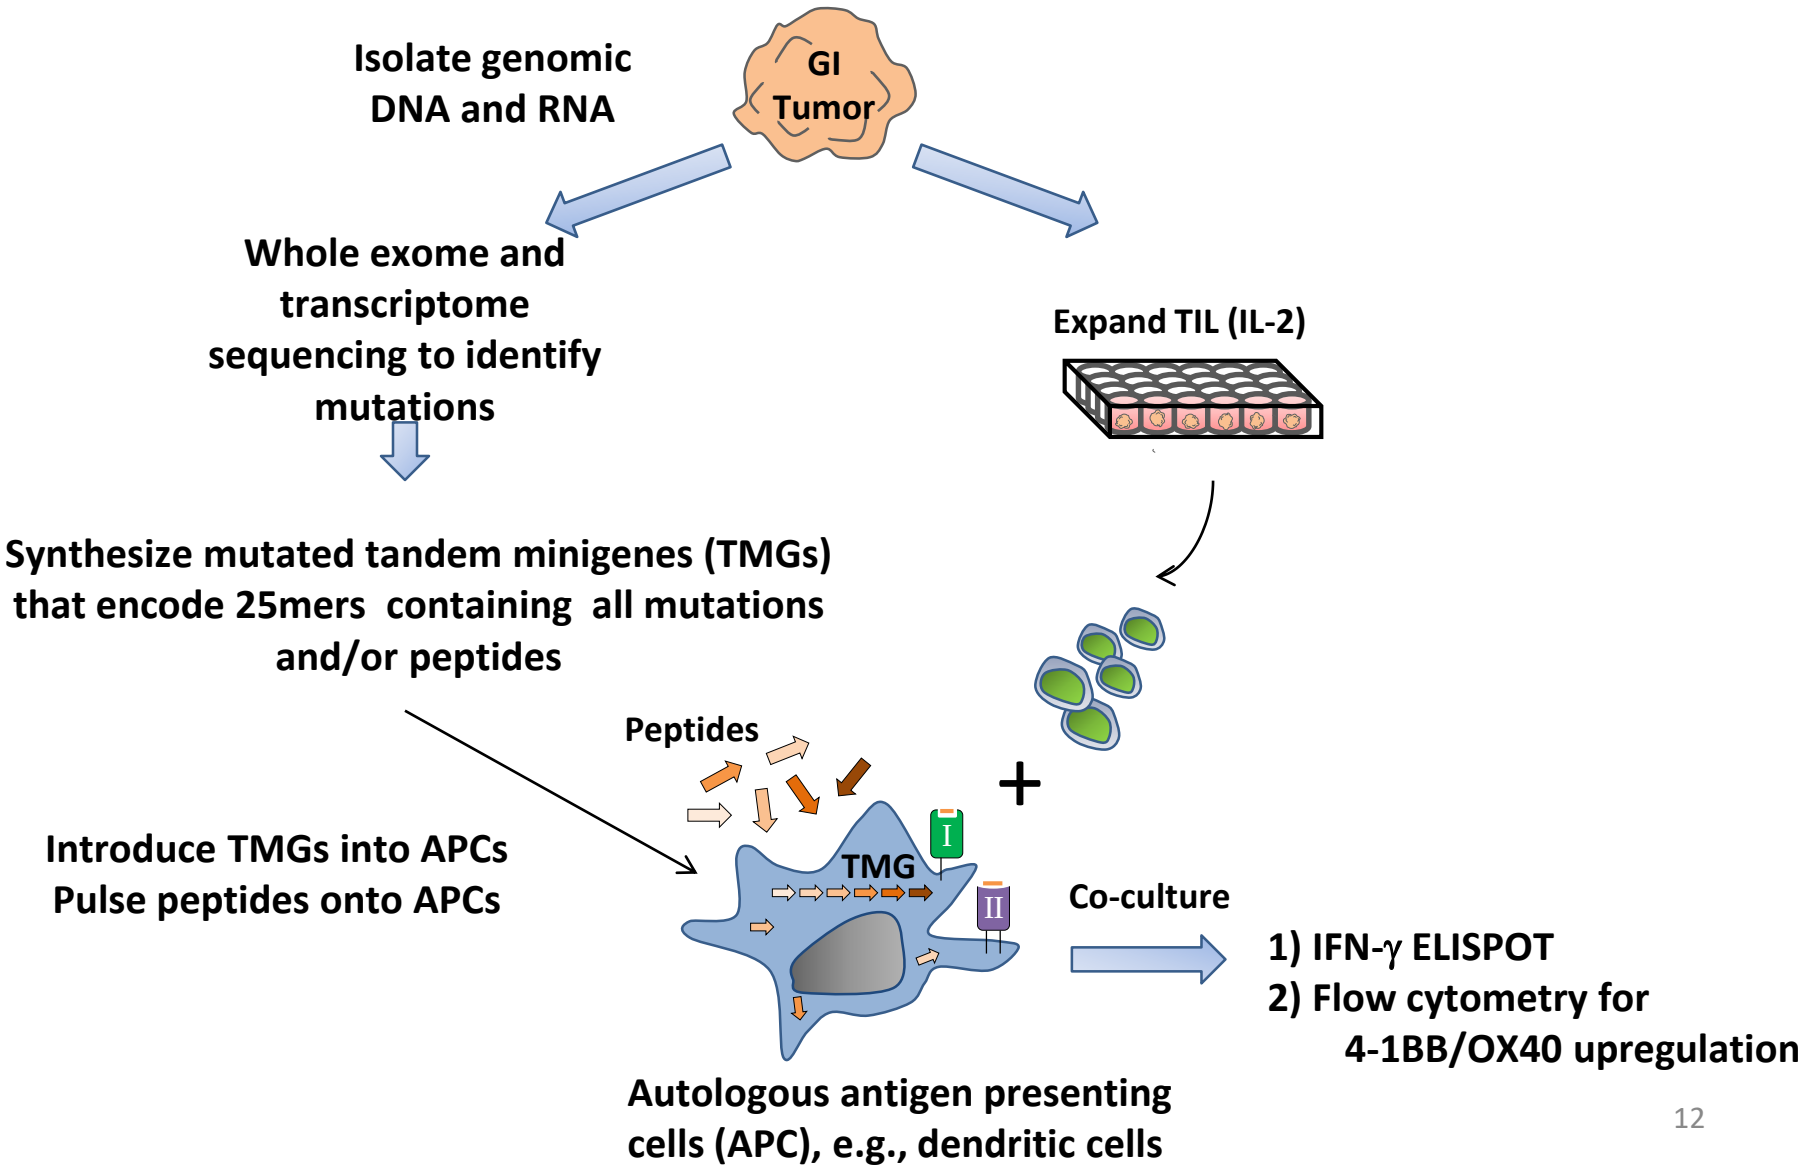
(Nature Med 19:747-752, 2013; Science 344:641-645, 2014)

Tandem minigene (TMG):

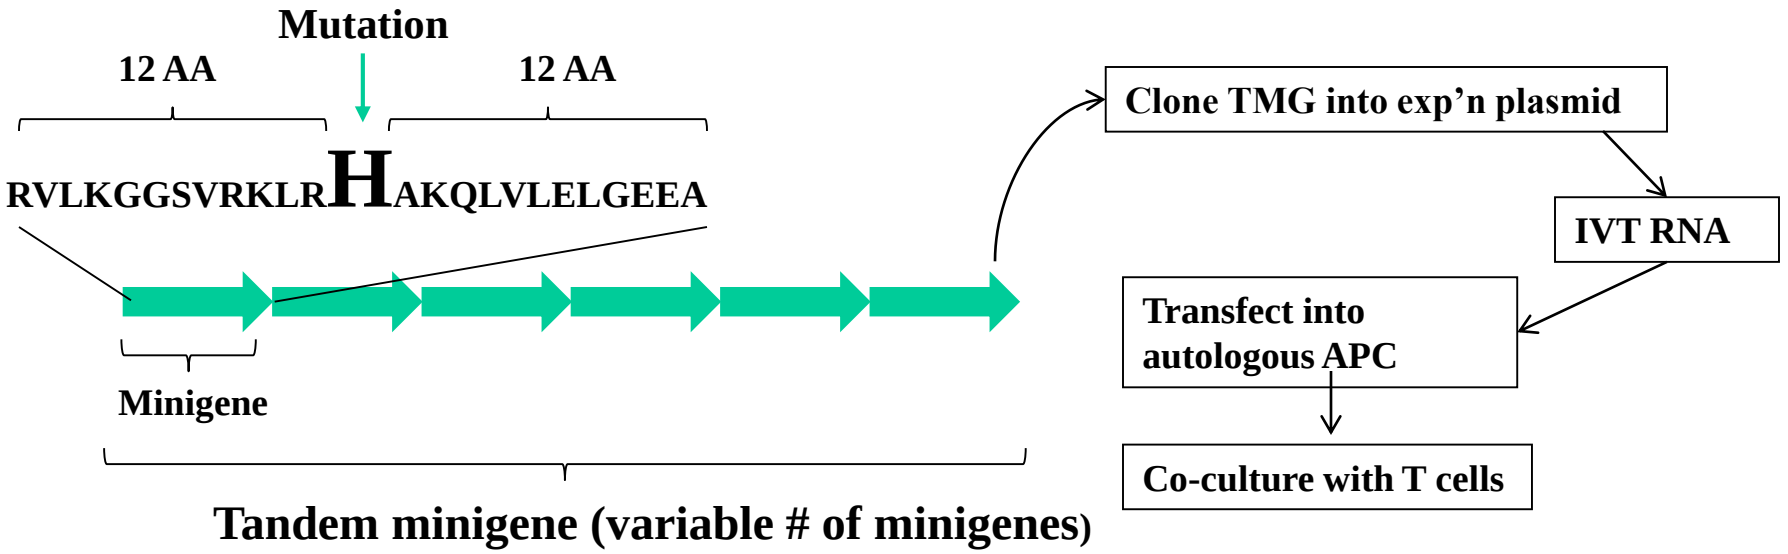
String of minigenes encoding the mutated AA flanked by 12 AA



Blueprint for the generation of mutation-reactive T-cells in common cancers



Tandem minigene (TMG):
String of minigenes encoding the mutated AA flanked by 12 AA



Advantages of this approach:

No need to predict peptide binding to MHC.

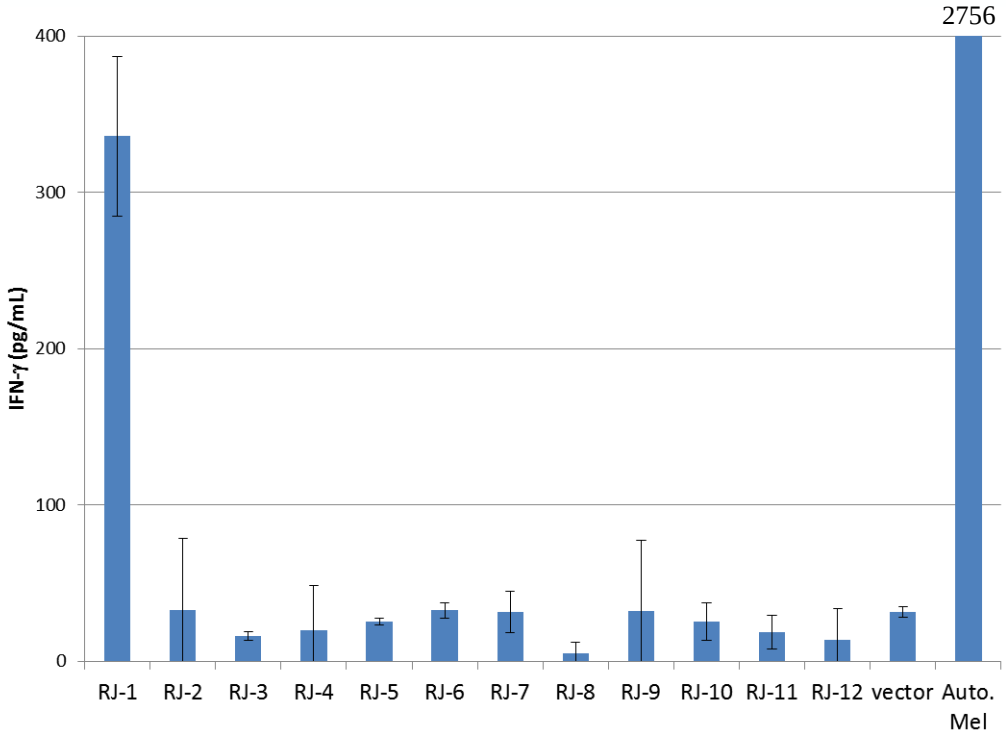
All candidate peptides and all MHC loci are included in the screen.

No tumor cell line necessary.

(Nature Med 19:747-752, 2013; Science 344:641-645, 2014)

Minigene approach: J. bulk TILs recognize tandem minigene RJ-1

A



71 non-synonymous mutations
12 tandem minigene constructs
HLA-A*0205

B

(updated 6/18)

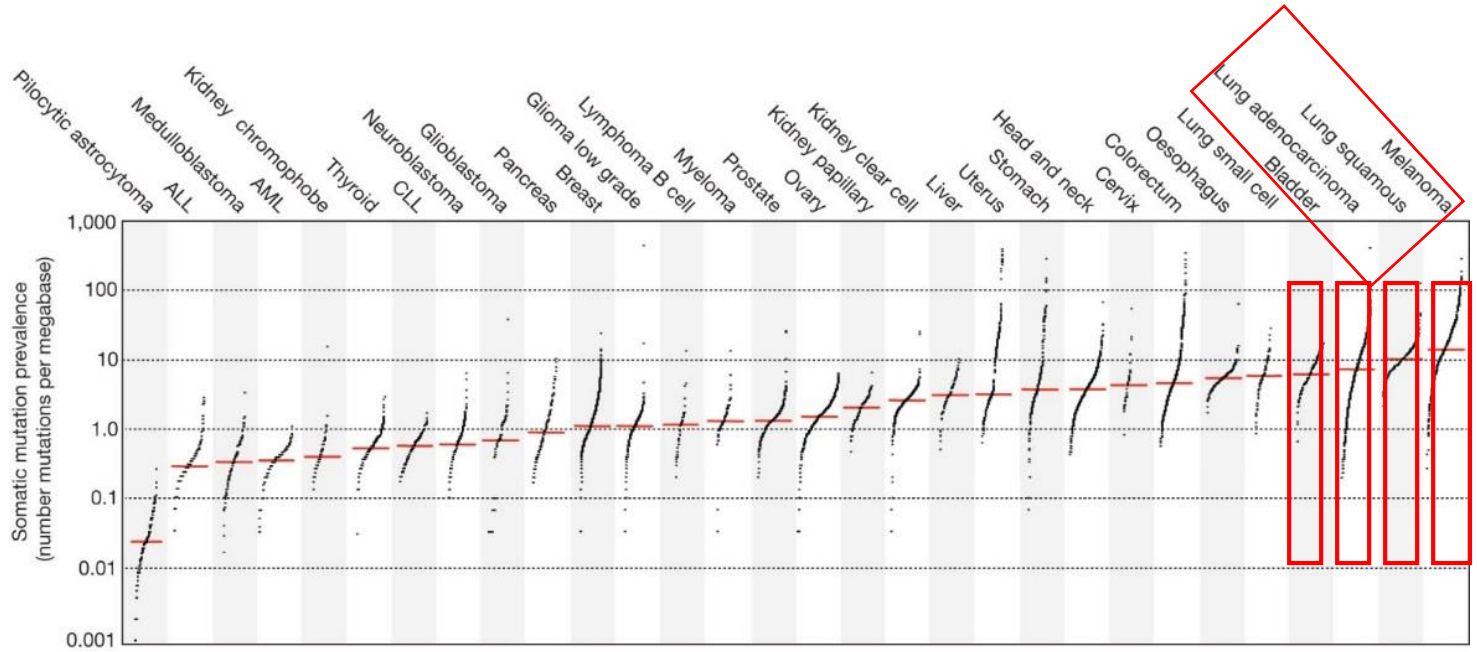
Preliminary Conclusion

Adoptive cell therapy mediates complete, durable, and likely curative, regressions of metastatic melanoma based on the recognition of immunogenic cancer mutations.

Can this insight be used to develop a "blueprint" for the treatment of common epithelial cancers?

Immunotherapy for Cancer Using Checkpoint Modulators

(**Alexandrov et al, *Nature* 2013**)



Limitations of Current Immunotherapies

The common epithelial cancers such as those arising in the colon, liver, stomach, pancreas, prostate, ovary, etc very rarely respond to current immunotherapies and account for over 80% of cancer deaths.

Are there antigens on the common epithelial human cancers that can be targeted by cell-based immunotherapy?

Patient M.B.

45 y.o. female with metastatic cholangiocarcinoma

12/2009	**Right hepatectomy for cholangiocarcinoma**
4/2010	**Multiple lung and liver metastases** **Received cisplatin and gemcitabine: PD**
5/2011	**Taxotere chemotherapy: PD in lung and liver**
3/2012	**Unselected TIL from resected lung lesion infused; PD**
10/2013	**TMG approach to target unique cancer mutations (26)**

Ongoing response and living normally 56 months later.

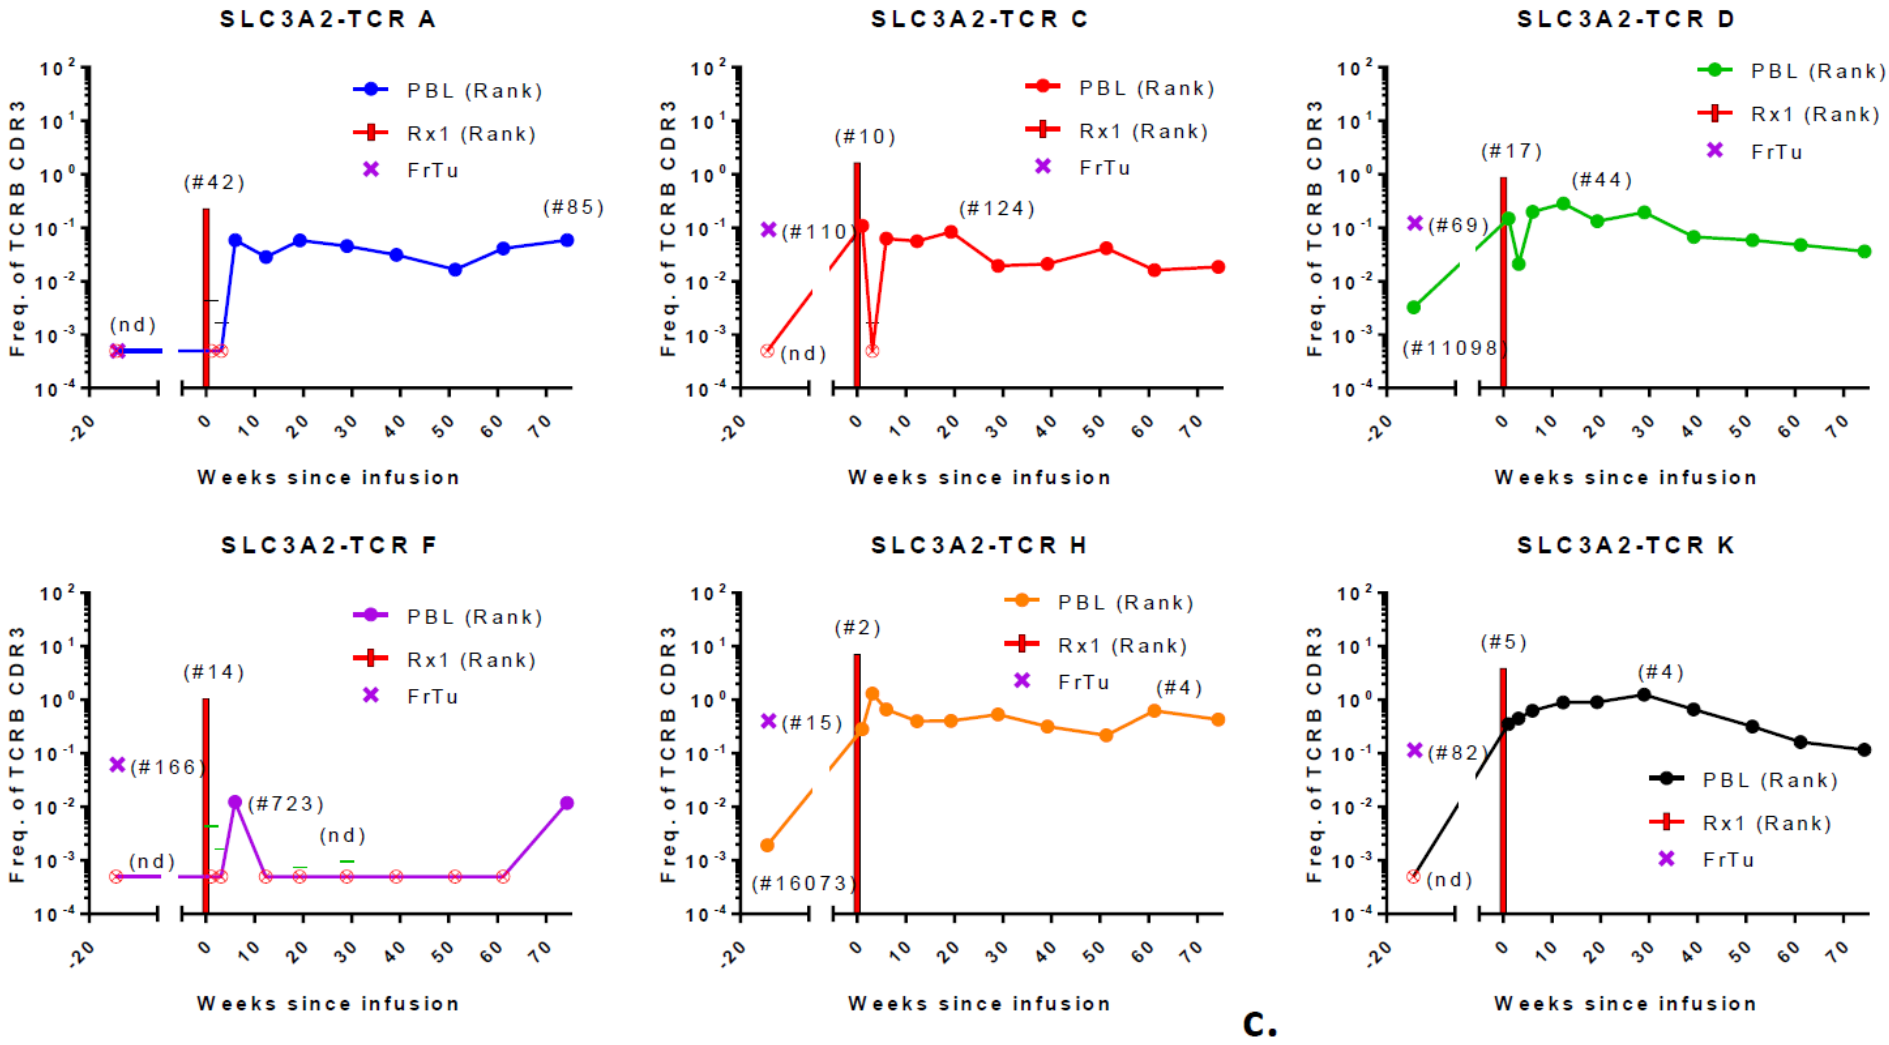
14 Months

Isolation and in vivo Persistence of Mutation-reactive Cells in a Patient with Breast Cancer



C.

Patient S.S.

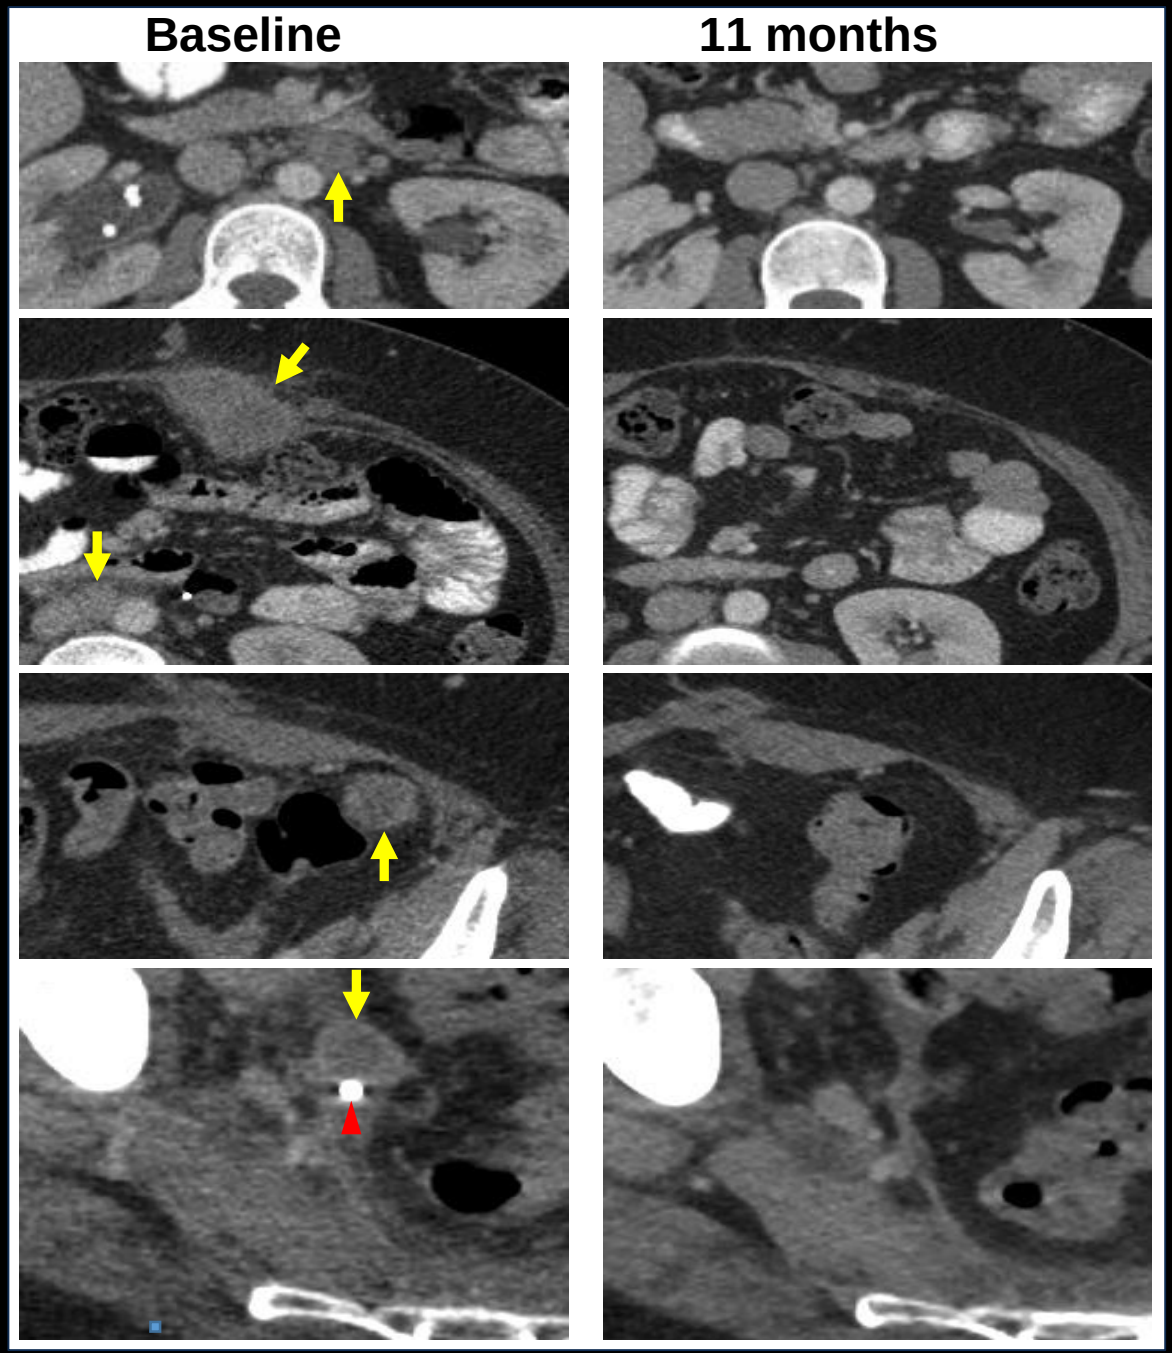
36 y.o. female with metastatic cervical cancer

10/2011	**Presented with fungating cervical mass, lung and intraperitoneal metastases**
11/29/11	**Radiation therapy and cisplatin chemotherapy**
10/06/12	**Cancer progressed. She underwent hysterectomy and excision of both ovaries**
11/2012 to 1/2013	**Developed liver, lymph node, intra-abdominal metastases and urinary tract obstruction requiring a stent**
3/15/13	**At NCI/Surgery Branch treated with cell transfer immunotherapy (75 billion of her own tumor infiltrating lymphocytes and IL-2)**

Experienced complete regression of all disease including relief of urinary obstruction and remains disease-free 4 years later.

(Stevanovic et al, Science 356:200, 2017)

Patient S.S. with metastatic cervical cancer treated with cell transfer immunotherapy



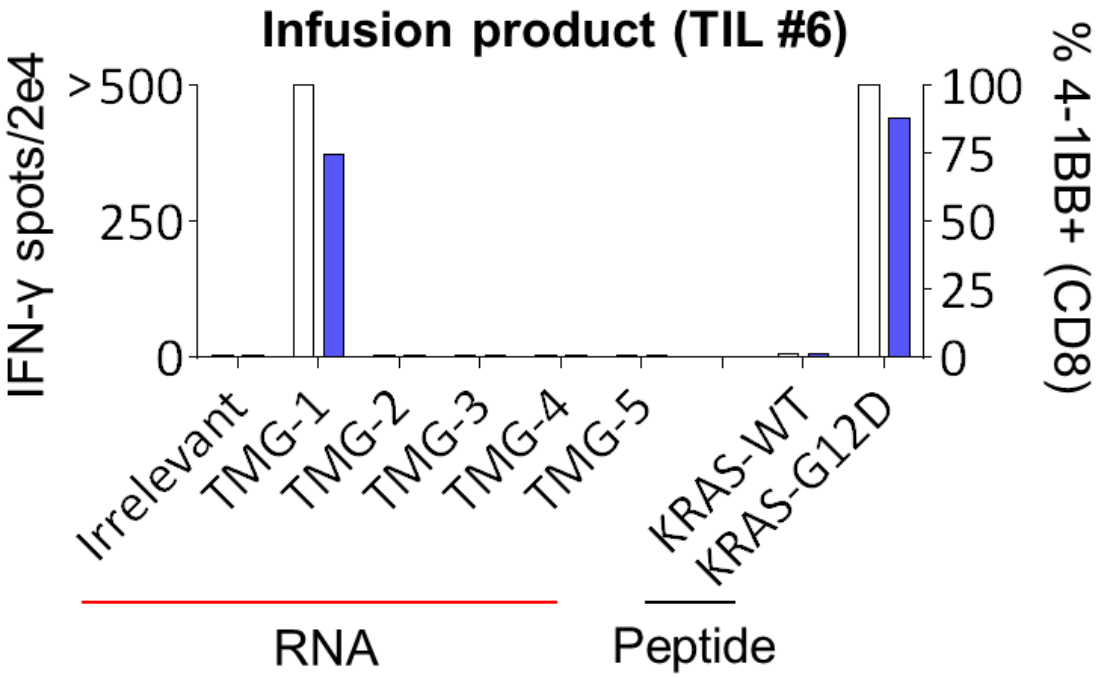
Patient C.R.

49 y.o. female with metastatic colon cancer

9/5/13	**Sigmoid colectomy, partial cystectomy** **Multiple lung metastases**
5/14/14	**Radiotherapy to bladder suture line**
9/13/14	**FOLFOX chemotherapy: PD**
3/29/15	**Two lung metastases resected for TIL**
7/1/15	**TMG approach to target unique cancer mutations** **(61 somatic mutations including KRAS-G12D)**

Patient CR (4095) with treatment refractory metastatic colorectal cancer

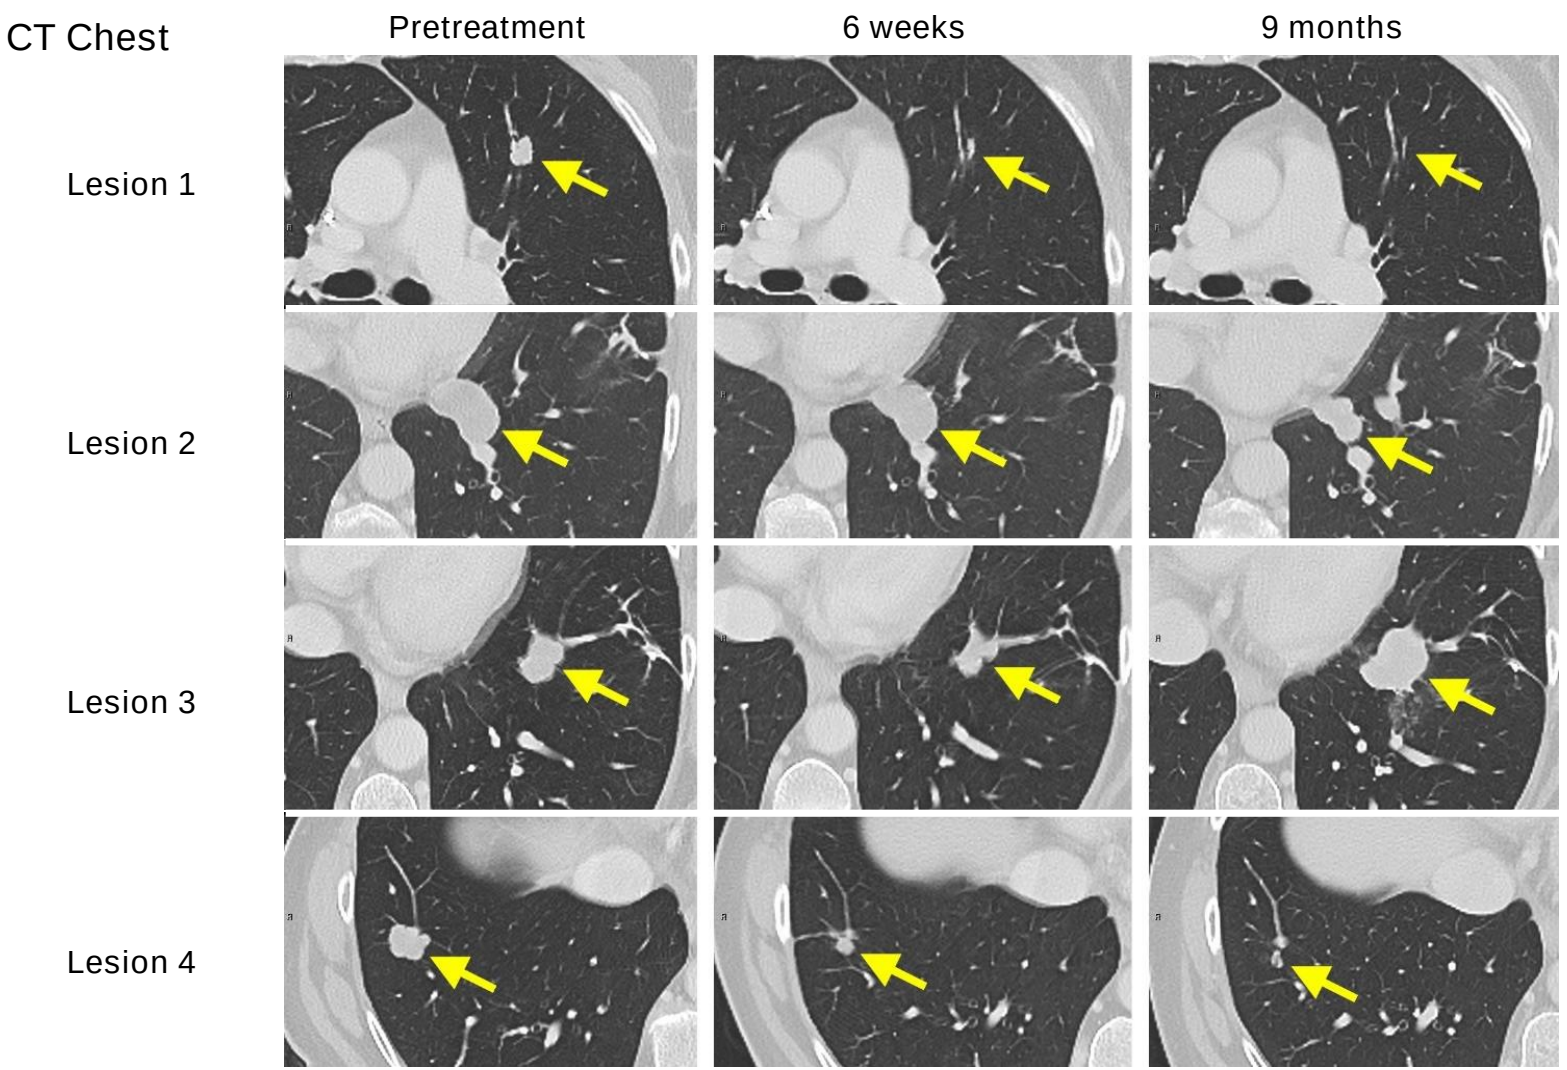
- **Whole-exome and transcriptome sequencing performed on lung lesions**
  - **61 putative mutations identified**
  - **5 TMGs constructed**



Rx:
- 1.48 x 10^{11} cells, ~75% $KRAS^{G12D}$-reactive
- 5 doses IL-2

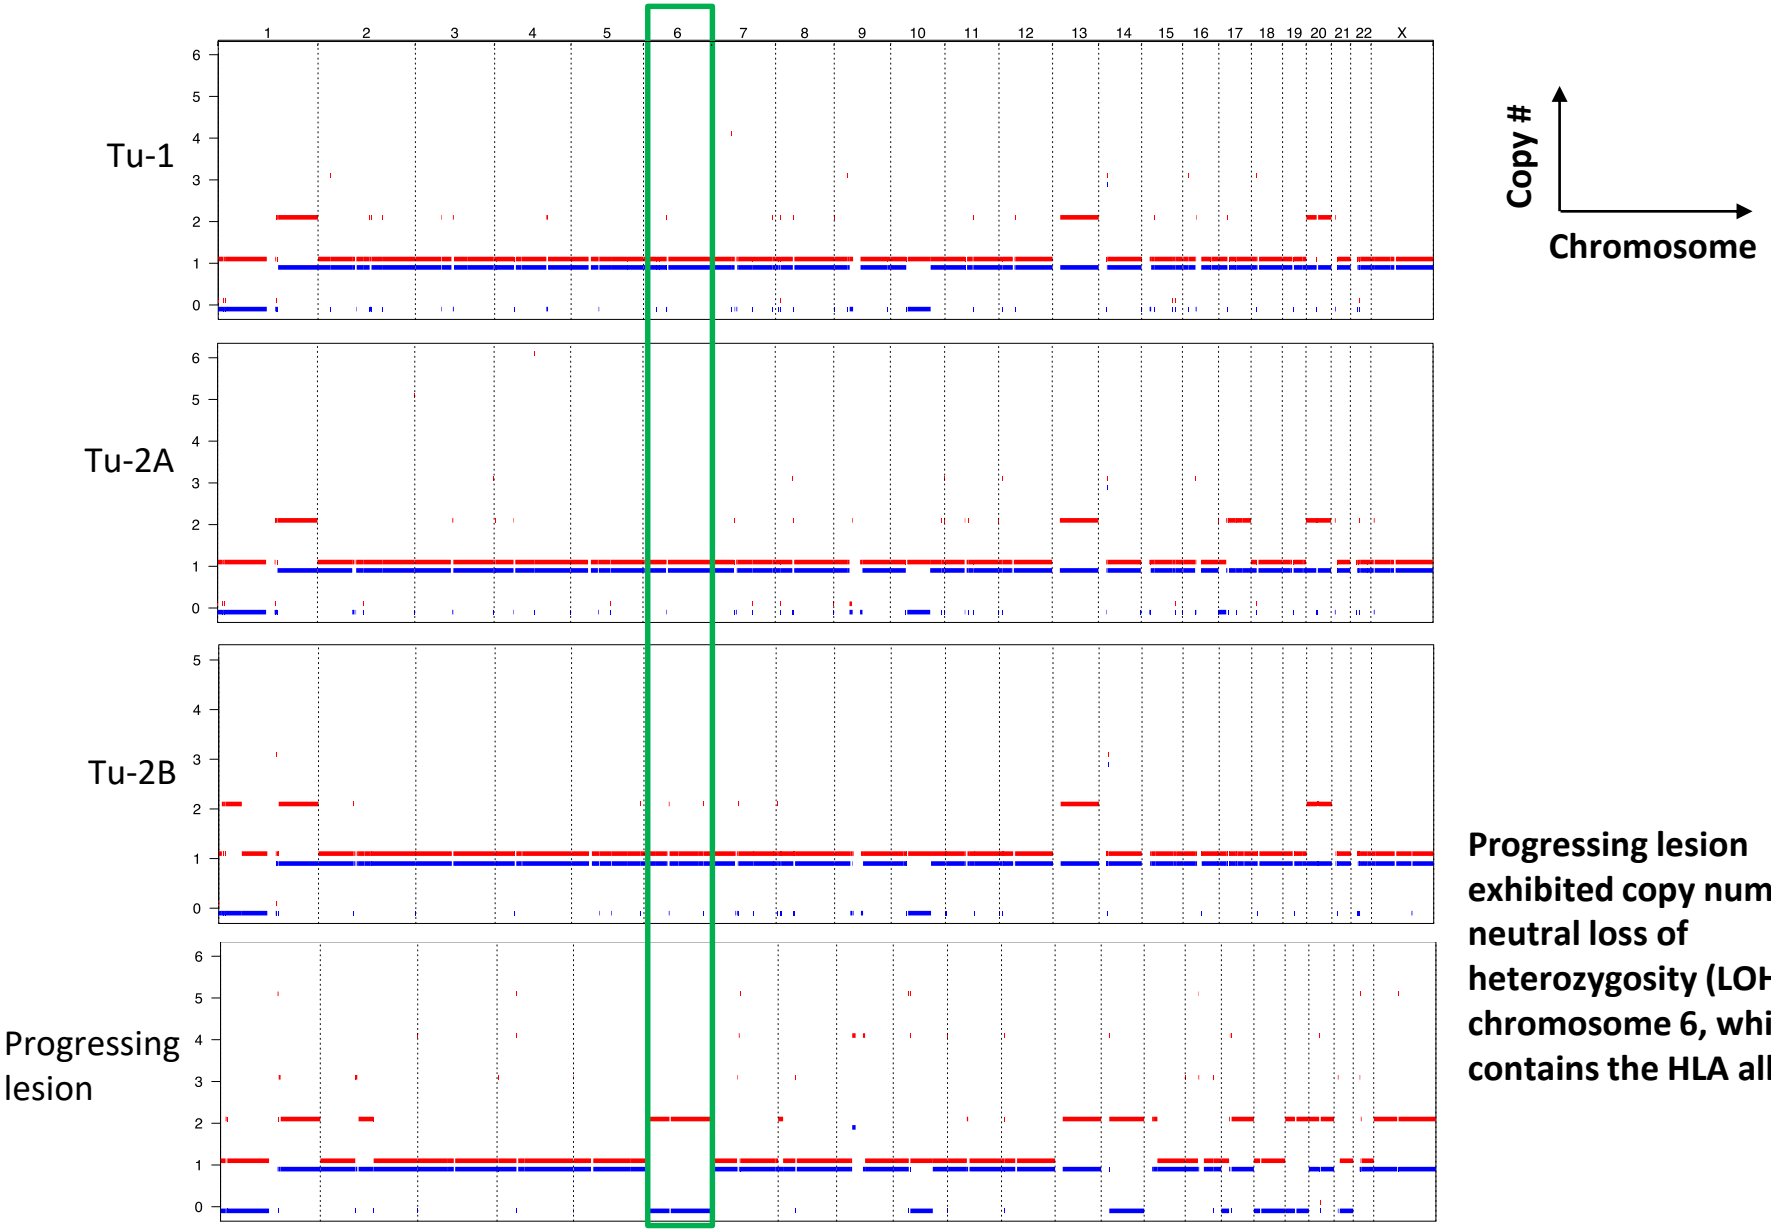
(Tran et al, New Engl J Med, 375, 2016)

Response after infusion with KRAS^{G12D}-reactive TIL



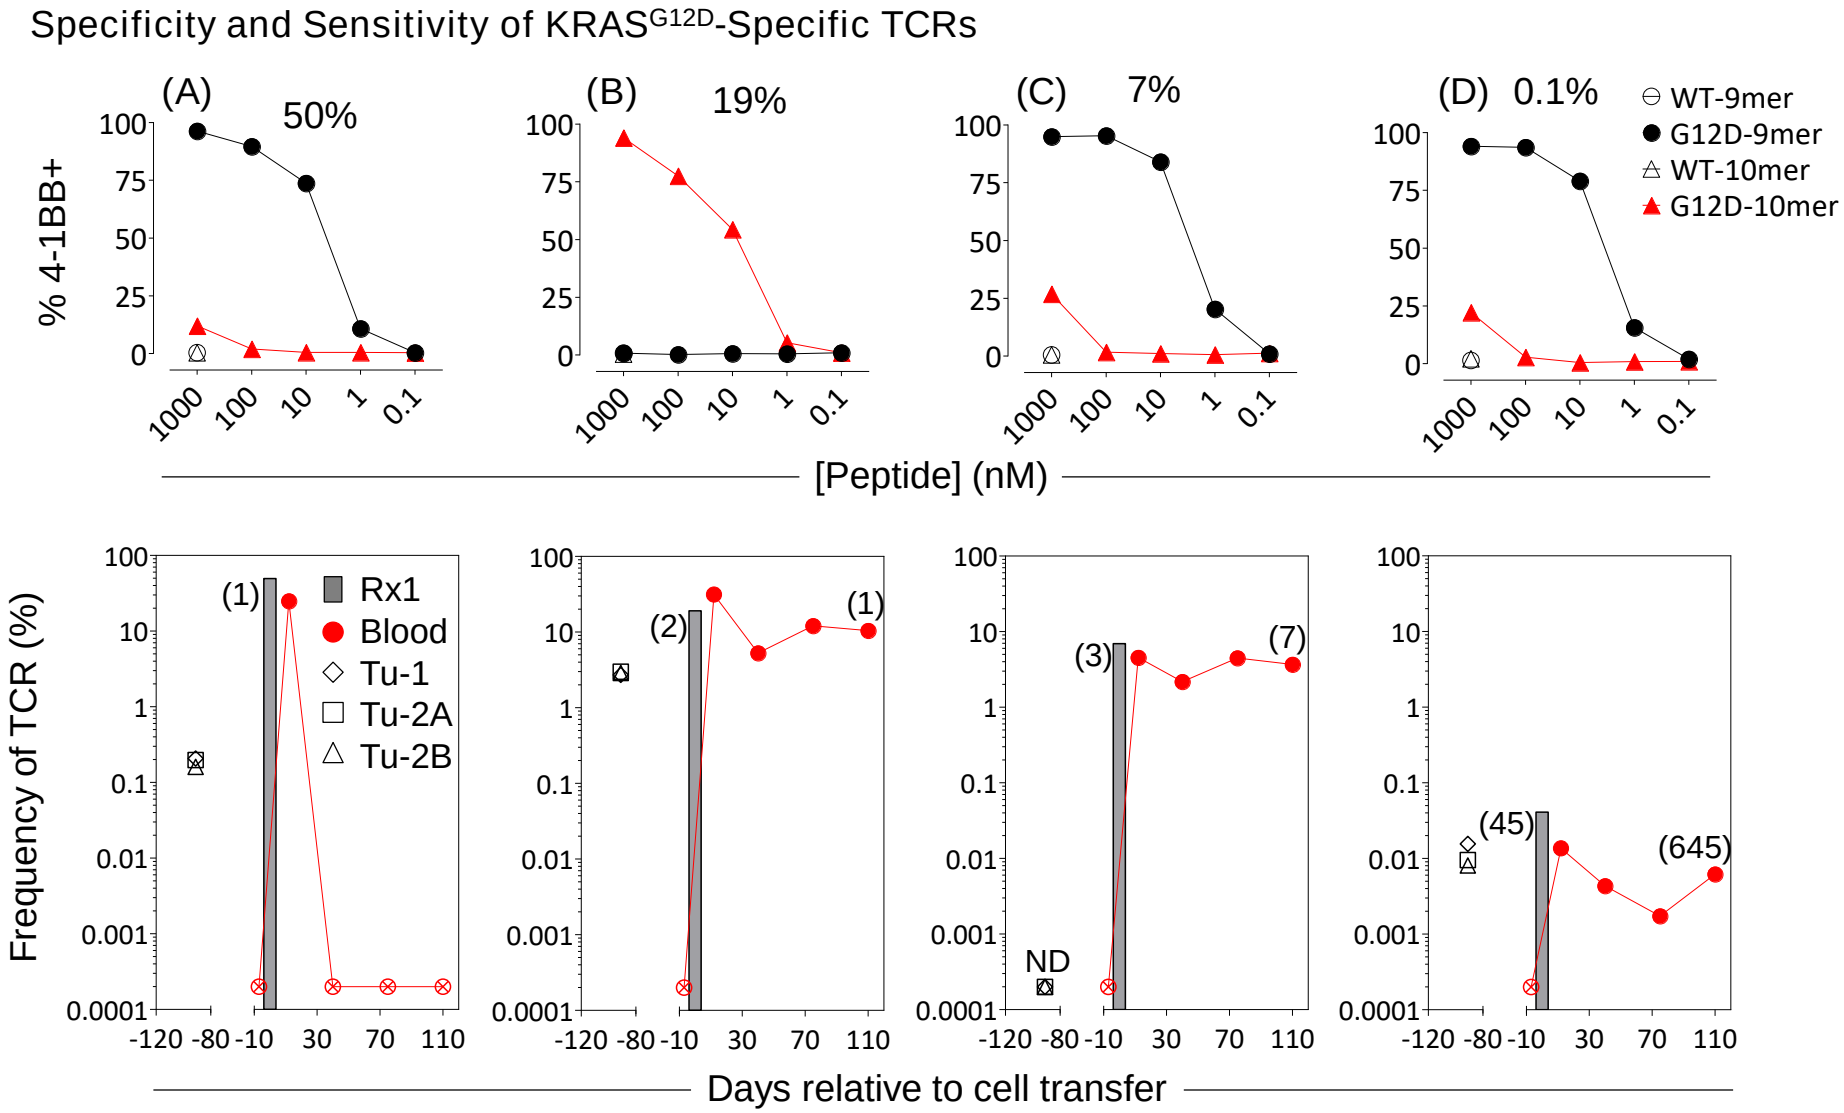
- **6/7 lesions regressed at 9 months post ACT**
- **1 lesion (#3) progressed at 9 months; excised; patient NED 35 months after treatment**

Why did one lesion progress? Chromosome copy number analysis



Progressing lesion exhibited copy number neutral loss of heterozygosity (LOH) at chromosome 6, which contains the HLA alleles

Four different KRAS^{G12D}-reactive TCRs in patient infusion TIL



Blueprint for Cancer Immunotherapy Directed Against the Common Epithelial Cancers

---

Target the immunogenic somatic mutations unique to the autologous patient's cancer.

Raise a library of T-cell receptors against shared cancer mutations (e.g. Kras, p53)

Hypothesis (2)

Any intracellular protein can potentially be a "cancer antigen" if mutated and processed intracellularly to a peptide that can bind to the autologous MHC.

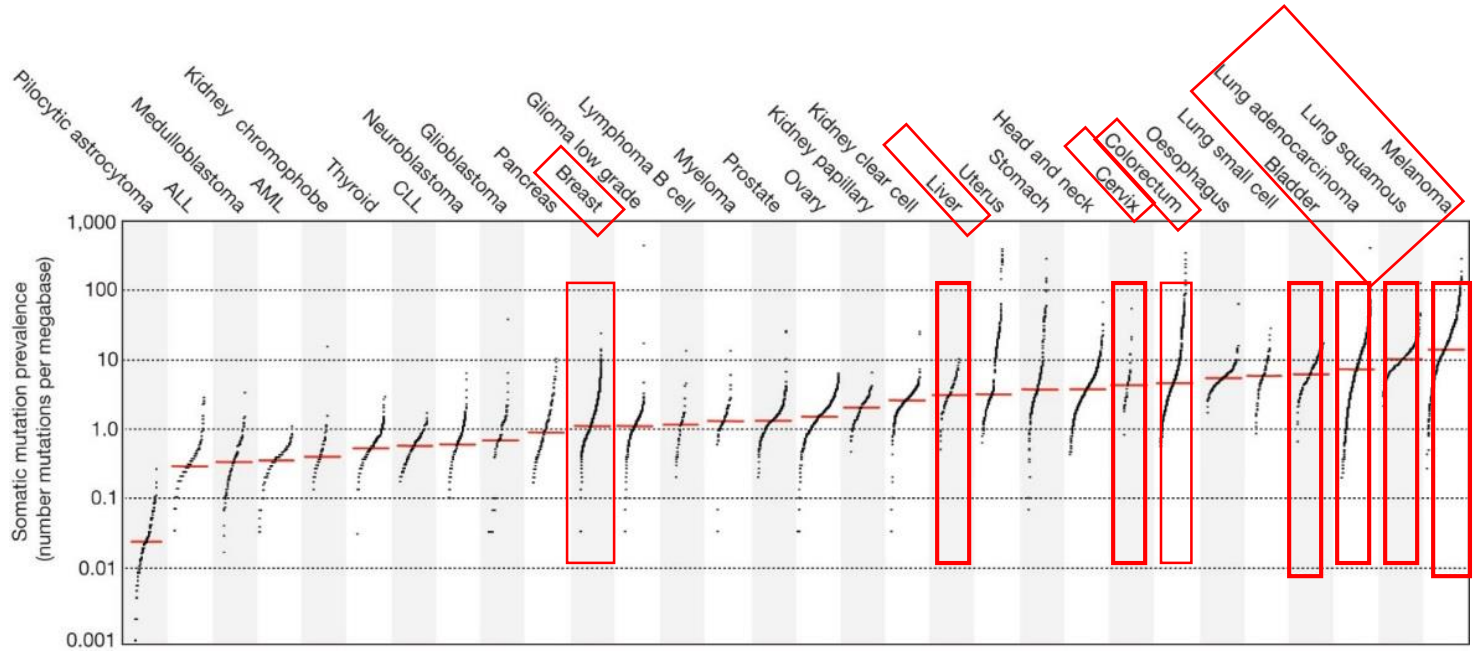
(About 1 in 70 mutated neoepitopes are neoantigens.)

Bad news: Treatment will be highly individualized and thus complex.

Good news: Virtually all cancer patients are potentially eligible.

Adoptive cell transfer for patients with cancer

(**Alexandrov et al, *Nature* 2013**)



Potential improvements in targeting of somatic mutations in epithelial cancers

---

Improve methods to identify multiple mutation targets expressed by tumor (robotics)

Develop rapid methods for identifying mutation-reactive TCRs (robotics)

Transduce mutation-reactive TCRs into naïve or CM cells (FDA approval 11-1-17 to use a GMP 293GP line to produce transient vectors with minimal testing)

Add anti-PD-1 (reexpressed by infused cells in vivo) or other CPM

Knockout CISH or PD-1 (or other inhibitory molecules) on transferred cells

Vaccinate with mutations recognized by transferred cells

Obtain mutation-reactive TCRs from circulating lymphocytes and mutations from paraffin sections or liquid DNA) – eliminate need for tumor resection

Cancer Antigens

1. **Unique somatic mutations in an intracellular protein**

2. **Mutations in driver oncogenes or tumor suppressor genes that can be shared among patients.**
   e.g.: Kras
   p53
   PIK3CA

3. **Non-mutated proteins on the surface of cells that are not essential for survival and can be recognized by antibodies or specific ligands**
   e.g.: CD19 (CAR: αCD19 antibody)
   CD70 (CAR: CD27 ligand)

KRAS Mutations and Human Cancers

KRAS protein is a GTPase essential for normal tissue signaling

Activating mutations are essential steps in the development of many cancers.

Tumor	Frequencies of KRAS mutation	% of All KRAS Mutations						
		G12A	G12D	G12R	G12C	G12S	G12V	G13D
Pancreatic CA	**70%**	2	**51**	12	3	2	**30**	1

Conclusions

Cell transfer therapy can mediate durable regressions in patients with metastatic cancer refractory to other treatments.

T-cells that recognize unique somatic mutations can be found in TIL and PBL in patients with common epithelial cancers.

Identification and targeting of mutations unique to each cancer or shared mutations such as KRAS or p53 has the potential to extend cell therapy to patients with common epithelial cancers.

* At the time of admission

† Neoantigen specificity was determined by testing against WT peptides

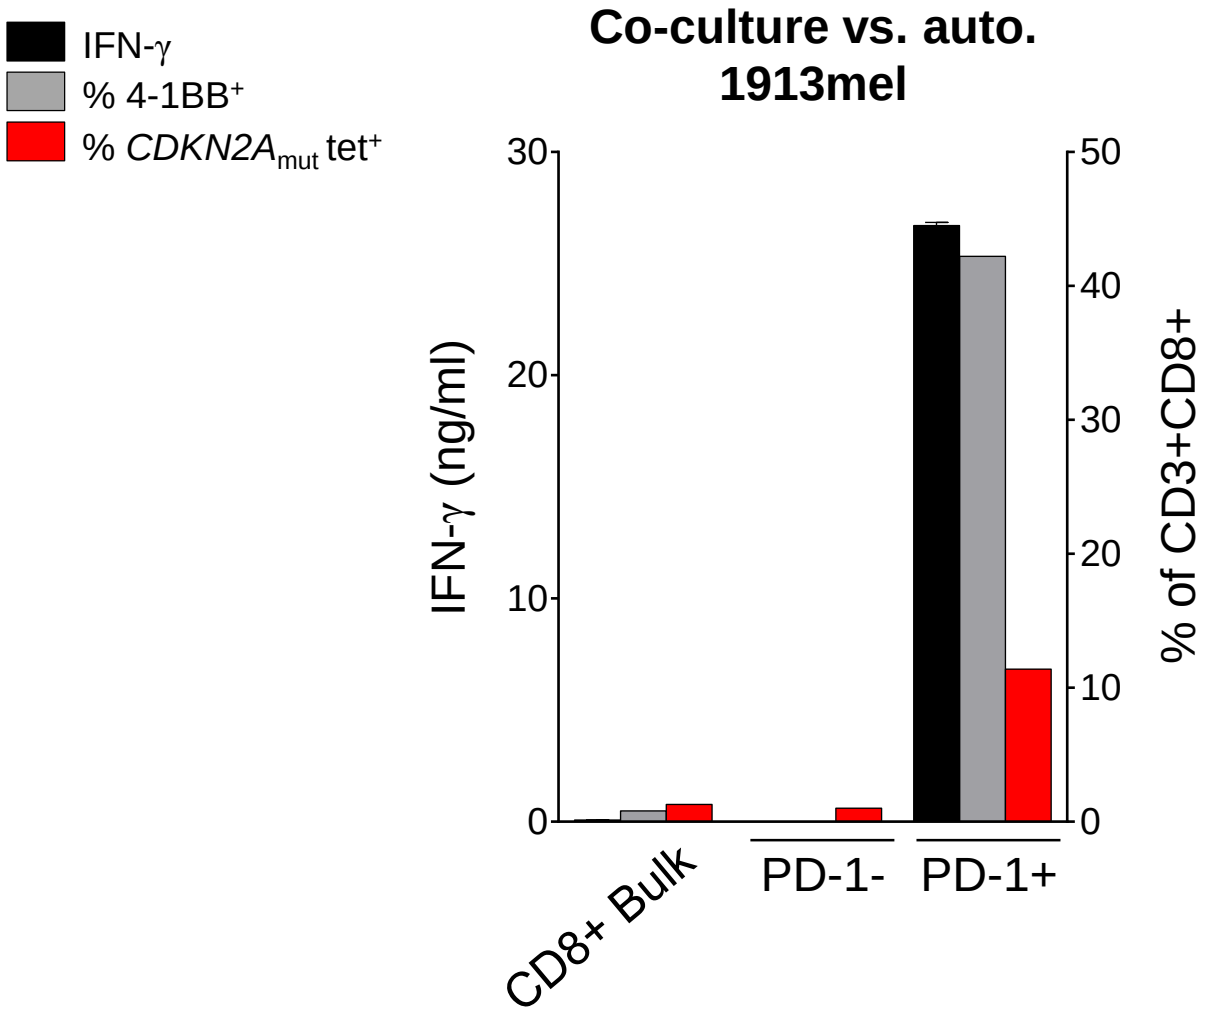
‡ TCR that were constructed and tested are bolded

§ FS Frame shift mutation

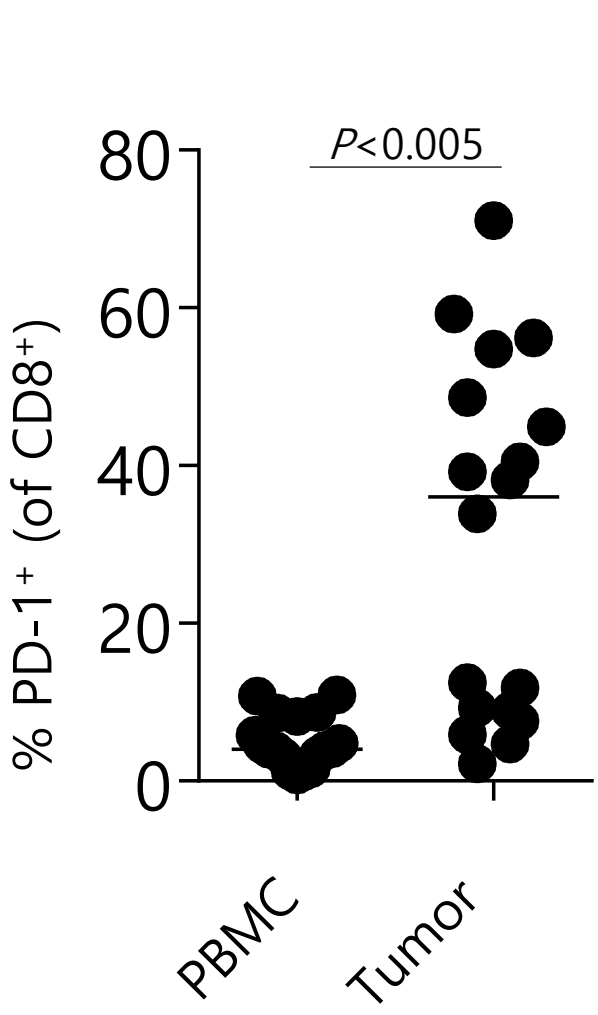
- We were able to rediscover most of the neo-antigen reactivities found in fragment screenings
- We identified substantial additional number of new reactivities that were missed when TIL fragments were screened
- Limiting dilution cultures are clonal or highly oligoclonal, that makes the isolation faster and more reliable using scPCR techniques

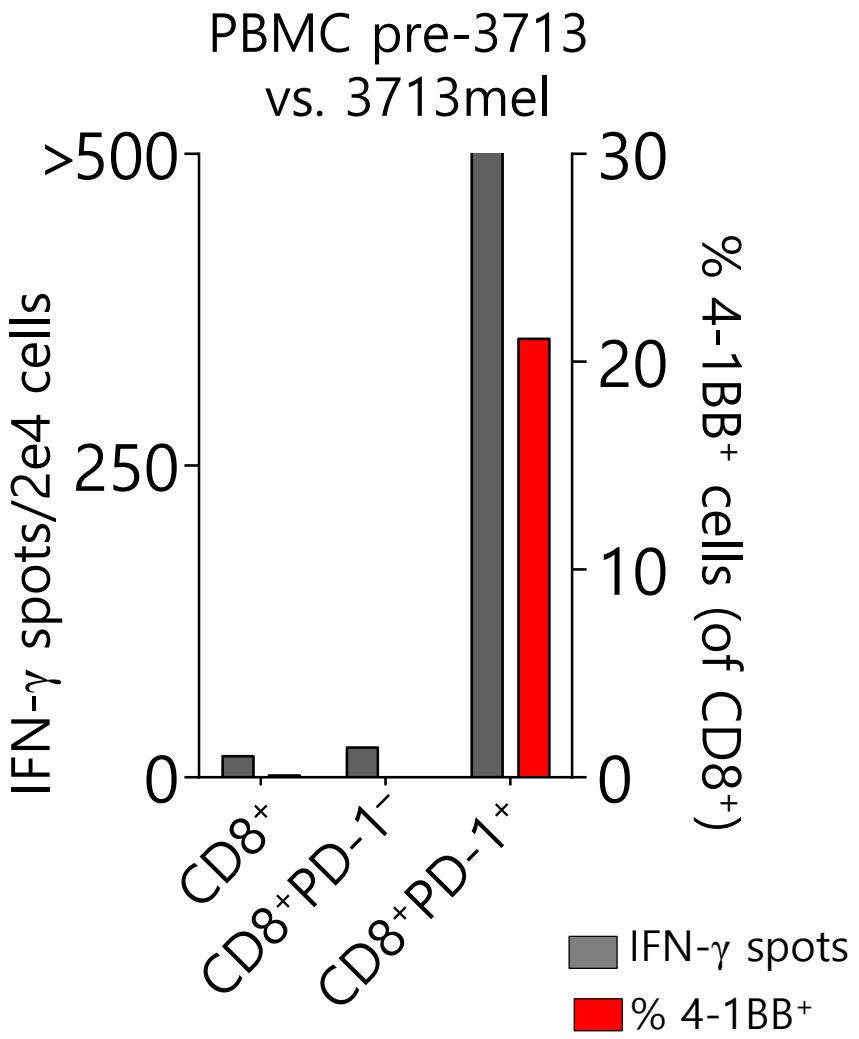
Tumor biopsies represent the main source for the isolation of tumor-reactive and mutation-specific lymphocytes

PD-1 expression in the fresh tumor can guide the identification of tumor-reactive cells (*Gros et al. JCI 2014*)



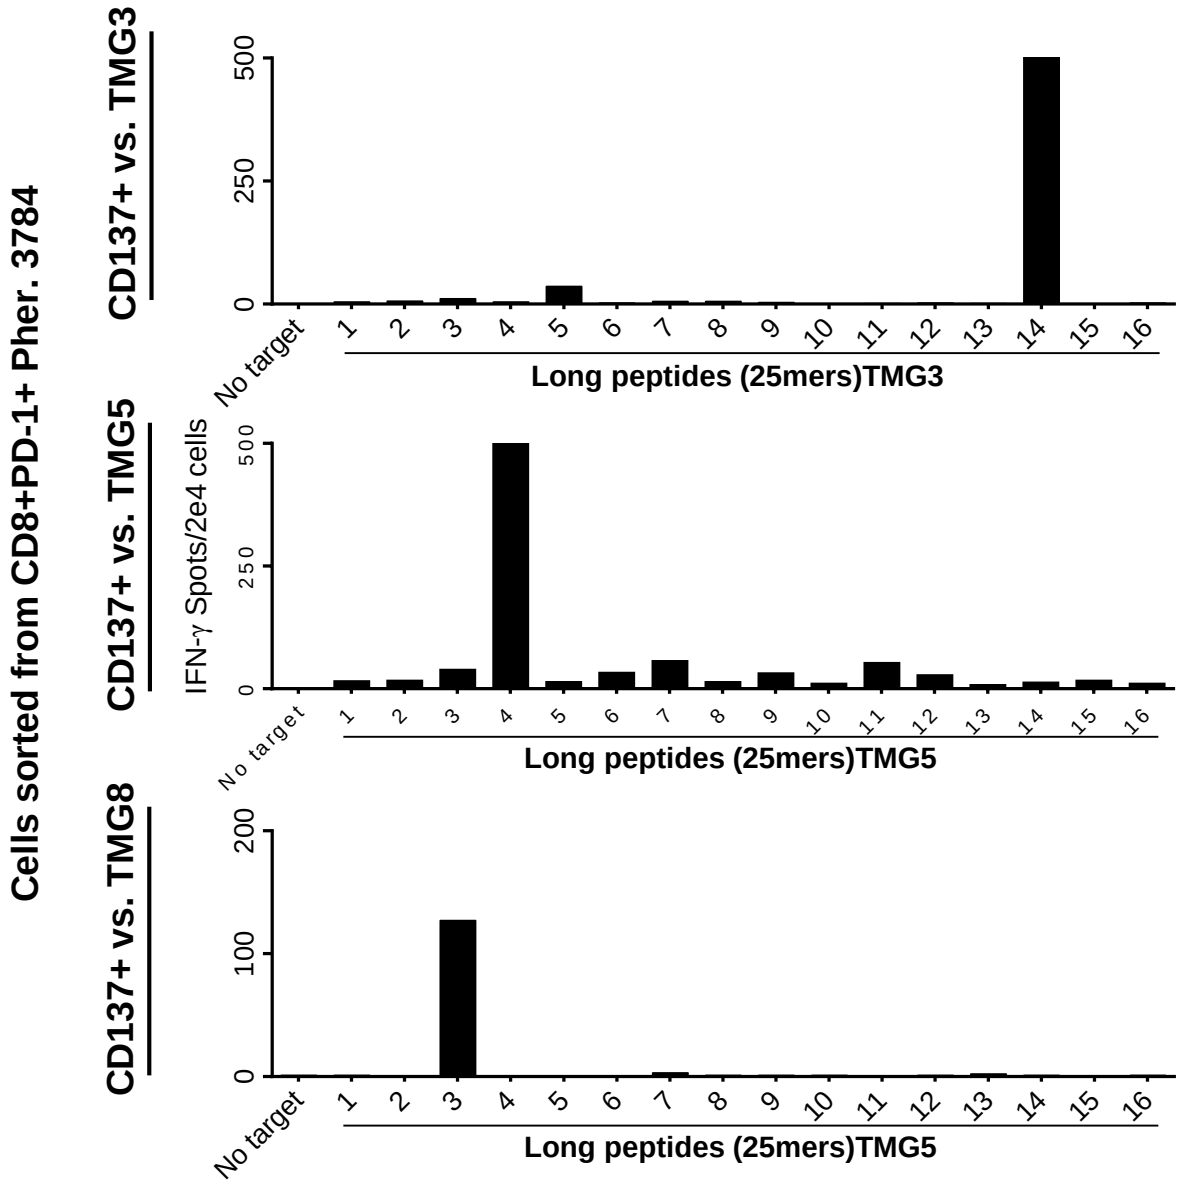
Enrichment of tumor and mutation-reactive cells by sorting for CD8+PD1+ cells





(Gros et al, J Clin Invest 124:2246-2259, 2014; Nat Med 22:433-438, 2016)

CD8+PD-1+ cells isolated from peripheral blood of Pt#3784 recognize three unique mutated antigens



FLNAmut: Filamin A
(cytoskeleton remodeling)
VVISQSEIGDASCVRVSGQGLHEGH

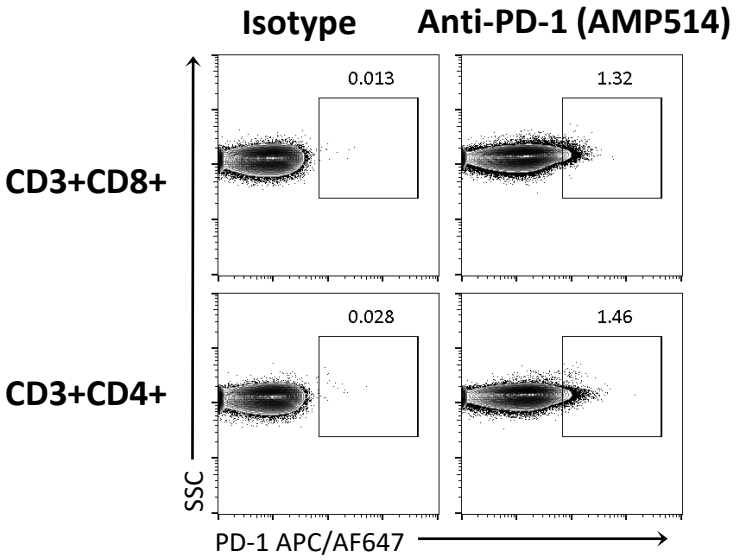
KIF16Bmut: Kinesin-like protein
(intracellular trafficking)
REKQQREALERAPARLERRHSALQR

SONmut: DNA binding protein
(promotes pre-mRNA splicing)
RKTVRARSRTPSCRSRSHTPSRRRR

Can mutation-specific cells be identified in peripheral blood of patients with gastrointestinal cancers?

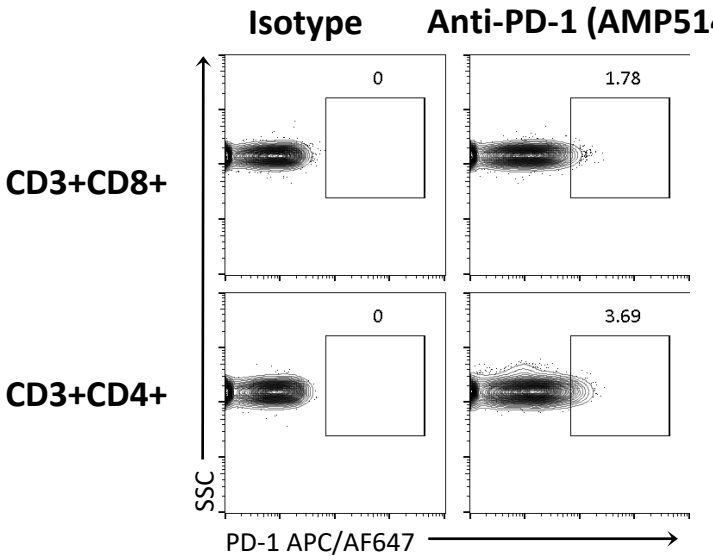
Metastatic gastric cancer: 175 mutations

Populations sorted from Pheresis:



1)CD8+
2) CD8+PD-1-
3) CD8+PD-1+
4) CD8+PD-1hi
5) CD4+
6) CD4+PD-1-
7) CD4+PD-1+
8) CD4+PD-1hi

Populations sorted from FrTu:



1)CD8+
2) CD8+PD-1-
3) CD8+PD-1+
4) CD4+
5) CD4+PD-1-
6) CD4+PD-1+

Evaluated recognition of 175 total putative mutations

Summary of neoantigen reactivities detected in the blood and tumor subsets derived from Pt.4078

Patient	Tumor	mutations evaluated	Pheresis		FrTu		TIL fragments	
			CD8+PD-1+/hi	CD4+PD-1+/hi	CD8+PD-1+	CD4+PD-1+	CD8+	CD4+
4078	GE	175	2 CD8+ (DLAT, GBAS)	3 CD4+ (TMPRSS4, TCF25, PSMD2)	2 CD8+ (DLAT, GBAS)	High background	0	0

Circulating CD8+PD-1+ cells AND intratumoral CD8+PD-1+ cells recognized DLAT and GBAS but only circulating lymphocytes recognized TM PRSS4, TCF25, PSMD2.

Thus improved techniques have the potential to identify increased T cells reactive with mutated antigens.

Summary - Human TCRs targeting *KRAS*^{G12} mutations identified in the Surgery Branch

Mutation	CD4/CD8	HLA restriction (*)	Minimal epitopes
KRAS p.G12V	CD4	HLA-DRB1*07:01 (25%)	
	CD8	HLA-A*11:01 (14%)	VVGAVGVGK VVVGAGGVGK
KRAS p.G12D	CD4	HLA-DR3*02 (16% **allele freq.**)	
	CD8 - 4 TCRs (E. Tran)	HLA-C*08:02 (11.7%)	GADGVGKSA (3 TCRs) GADGVGKSAL (1 TCR)
	CD4	HLA-DRB1*08:01 (~4.5%)	
KRAS p.G12C	CD4 (G. Cafri)	HLA-DRB1*11*01 (10%)	
KRAS p.G12R	CD4 (M. Parkurst, A Sachs)	TDB	

* % US Caucasians individuals that have the allele in - Allelefrequencies.net

Identify additional TCRs targeting *KRAS* mutations from other potential candidates

Dr. James Yang laboratory has isolated G12V and G12D HLA-A11 restricted KRAS TCRs.

Limitations of Current Immunotherapies

Treatment using checkpoint modulators or adoptive cell therapy with unselected TIL can be effective in treating tumors with high mutation rates (melanoma, smoking-induced lung cancer, some bladder cancers).

The common epithelial cancers such as those arising in the colon, liver, stomach, pancreas, prostate, ovary, etc rarely respond to current immunotherapies.

Are there antigens on the common epithelial human cancers that can be targeted by cell-based immunotherapy?

Major Challenge Confronting Cancer Immunotherapy

The development of effective immunotherapies for the 80% of patients with metastatic epithelial solid cancers that cannot be cured by any available treatment.

Estimated Cancer Deaths in 2017 in the U.S.

	New Cases	Deaths
Total	1,688,780	600,920
Solid cancers	1,515,870	542,620
Hematologic	172,910	58,300

(American Cancer Society, 2017)

Systemic Treatments that Can Cure Metastatic Solid Cancers

1958	**methotrexate for choriocarcinoma (Min Chiu Li, NCI)**
1977	**cis-platin combination chemotherapy for germ-cell testicular cancers (Lawrence Einhorn, U. Indiana)**
1985	**interleukin-2 for melanoma and renal cancer**

Potential improvements in targeting of somatic mutations in epithelial cancers

---

Enrich cancer mutation-reactive cells

- **PD1+ cells in tumor and circulating lymphocytes**
- **41BB+ after antigen stimulation**

Improve methods to identify multiple mutation targets expressed by tumor (robotics)

Develop rapid methods for identifying mutation-reactive TCRs (robotics)

Transduce mutation-reactive TCRs into naïve or CM cells (FDA approval 11-1-17)

Add anti-PD-1 (reexpressed by infused cells in vivo) or other CPM

Knockout CISH or PD-1 (or other inhibitory molecules) on transferred cells

Vaccinate with mutations recognized by transferred cells

Obtain mutation-reactive TCRs from circulating lymphocytes and mutations from paraffin sections or liquid DNA) – eliminate need for tumor resection

Potential improvements in targeting of somatic mutations in epithelial cancers

---

Improve methods to identify multiple mutation targets expressed by tumor (robotics)

Develop rapid methods for identifying mutation-reactive TCRs (robotics)

Transduce mutation-reactive TCRs into naïve or CM cells (FDA approval 11-1-17 to use a GMP 293GP line to produce transient vectors with minimal testing)

Add anti-PD-1 (reexpressed by infused cells in vivo) or other CPM

Knockout CISH or PD-1 (or other inhibitory molecules) on transferred cells

Vaccinate with mutations recognized by transferred cells

Raise libraries of TCRs reactive with shared KRAS or P53 mutations (?other driver genes)

Obtain mutation-reactive TCRs from circulating lymphocytes and mutations from paraffin sections or liquid DNA) – eliminate need for tumor resection

Cooperative Research and Development Agreement for the Development of T cell Therapy Using Neoantigen Reactive T Cell Receptors Retrovirally Transduced into Autologous Peripheral Blood Lymphocytes

<u>Experimental Plan</u>

1. **To generate clinical proof-of-concept data for personalized neoAg TCR-engineered T-cell therapy using retroviral insertion.**

2. **To develop a streamlined, high-throughput process for neoAgTCR isolation from peripheral blood lymphocytes (PBL).**

3. **To evaluate the safety and efficacy of KRAS mutation targeting TCR therapy**

Conclusions

Peripheral blood CD8+PD-1+ lymphocytes represent a small subset of all the circulating CD8+ cells

The CD8+PD-1+ lymphocyte subset in peripheral blood can contain multiple mutation-specific cells capable of recognizing tumor

Each immunogenic mutation detected was unique to the autologous tumor

Circulating CD8+PD-1+ lymphocytes from melanoma patients also contain T cells recognizing shared tumor antigens

Mutated antigens recognized by TIL from patients with melanoma

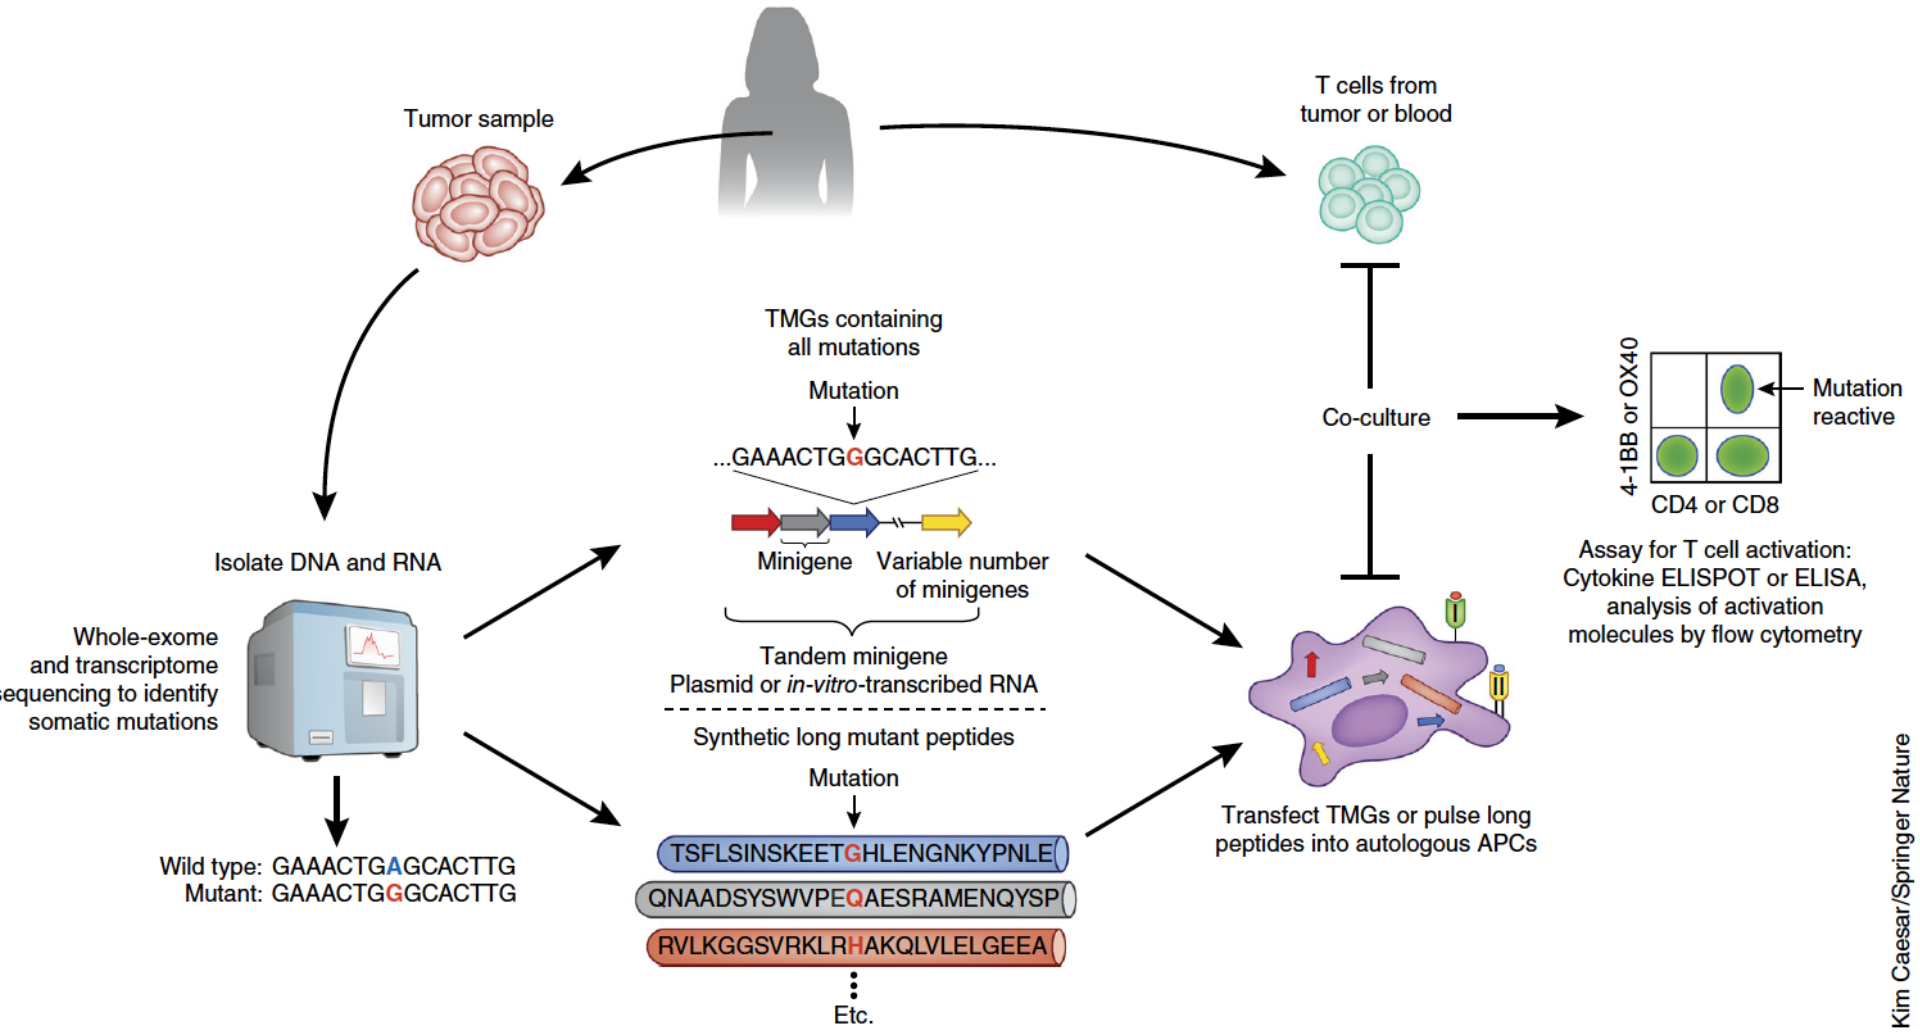
78 neoepitopes identified as targets of autologous TIL from 34 patients with melanoma.
31 of 34 (91%) expressed neoantigens. All were unique. (unpublished)

Identification of neoantigen-reactive T cells from patients with cancer



Kim Caesar/Springer Nature

Conclusions

Cell transfer therapy can mediate durable regressions in patients with metastatic cancer refractory to other treatments.

T-cells that recognize unique somatic mutations can be found in TIL and PBL.

Identification and targeting of mutations unique to each cancer has the potential to extend cell therapy to patients with common epithelial cancers.

Cancer Antigens

1. **Unique somatic mutations in an intracellular protein**

2. **Mutations in oncogenes or tumor suppressor genes that can thus be shared among patients.**
   e.g.: Kras
   p53

3. **Non-mutated proteins on the surface of cells that are not essential for survival and can be recognized by antibodies or specific ligands**
   e.g.: CD19 (CAR: αCD19 antibody)

Construction of T-cell Receptors (TCR) and Chimeric Antigen Receptors (CAR)
