Imaging in the CCR: From Molecules to Man

Robert H. Wiltrout, Director, SD for Basic Science
Lee J. Helman, SD for Clinical Research
December 2010
CCR Vision
Integrate basic, translational, and clinical research to make cancer preventable, curable, or chronically manageable.

CCR Mission
To inform and empower the entire cancer research community by making breakthrough discoveries in basic and clinical cancer research and by developing them into novel therapeutic interventions for adults and children afflicted with cancer or infected with HIV.
CCR Seeks to Achieve Its Mission By:

- Performing rigorous basic scientific research
- Translating these advances rapidly from the laboratory to the clinic
- Developing innovative technologies for detection, diagnoses, and treatment
- Pioneering novel interventions for underserved patient populations and rare cancers
- Sharing expertise, scientific data and technologies
- Training future physician-scientists and biomedical researchers
Imaging is a CCR Priority

- Blur the line between imaging and pathology
- Develop novel imaging approaches and technology:
  - Basic discovery research
  - Translational applications
  - Non-invasive patient care
- Improve imaging techniques to enhance early detection, diagnosis, and treatment
  - Preclinical model testing and validation
  - Clinical trial design and implementation
- Develop novel imaging instrumentation
- Preemptive medicine
  - Detect lesion
  - Determine pathway
  - Monitor for reactivation
  - Intervene upon re-activation, before gross tumor recurrence
Imaging in the CCR

**Animal**
- NIH Mouse Imaging Facility—Bethesda Campus
- Small Animal Imaging Program—Frederick Campus

**Human**
- Molecular Imaging Clinic
- Interventional Oncology
- ROB
- RBB
NIH Center for Interventional Oncology

• Offers new and expanded opportunities to investigate cancer therapies that use imaging technology to diagnose and treat localized cancers in ways that are precisely targeted and minimally or non-invasive
  • Cutting edge technology
    • MRI, PET, CT
• Ideally and uniquely positioned to provide an interdisciplinary environment combining training, patient treatment, translational research and development in interventional oncology

Brad Wood
Major program components will include:

- Interdisciplinary training and education in interventional oncology
- Development of new image-guided for methods for personalized drug investigations
- Image-guided “dose-painting”—tailoring drug delivery based on disease location
- Use of ‘medical GPS’ for tumor biopsy and treatment
- First-in-human investigations involving new drugs, devices, molecular probes, nanoparticles, and targeted therapies
- Interdisciplinary research involving novel technologies in interventional oncology
